Holmberg, A. Matthews, 1994-07-15 This book presents a general view on thin surface coatings used for tribological applications and it is based on the current state of understanding The mechanisms of friction and wear in sliding and rolling contacts of coated surfaces are described Basic information on coating techniques tribology and surface mechanisms is given Based on collected experimental works information is given on the properties of thin soft coatings such

as polymer lamellar solid and soft metal coatings thin hard coatings such as nitride carbide oxide boride and diamond and diamond like coatings and multi component and multi layer coatings The influence of interface layers and lubricants is highlighted The methods available for characterization of coated surfaces and for mechanical and chemical evaluation of their tribological properties are described Tribological evaluation methods for accelerated and field testing and the need for standardization of quality assurance procedures are discussed A methodology for the selection of thin coatings for tribological applications is presented and knowledge based expert system approaches for coating selection are reviewed For different application examples the basic tribological contact mechanisms are described and the possibilities for improving their tribological properties by using surface coatings are discussed The application examples include sliding and rolling bearings gears tools for cutting and forming erosion resistant applications magnetic recording systems and bio medical implants

**Thin Films in Tribology** G. Dalmaz, P.R.N. Childs, D. Dowson, M. Godet, C.M. Taylor, 1993-09-06 The tribological properties of relatively moving surfaces are greatly influenced by thin surface films which are of considerable importance in the design of machine components From Victorian days when working lubricant films were calculated in tens of micrometres to today when molecular dynamics simulations and even experiments are beginning to look at nanometre single molecule thick films the study of surfaces which is the tribologists challenge has moved to finer and finer scales The 66 papers in this volume provide reviews across the tribological field with thin films as their theme giving a comprehensive and concise description on topics ranging from coatings and surface modification to bio tribology The articles provide the reader with an outline of their most effective application and potential uses in new technologies The volume will be of interest not only to research workers and design engineers in the fields of new machine developments and lubrication but also to engineers and students specialising in tribology

**Mechanics of Components with Treated or Coated Surfaces** Jaroslav Mencík, 2013-03-14 Surface treatment is an efficient means for protection of various products against corrosion and also for increasing strength or resistance to wear or fatigue Also certain electrical chemical or optical properties may be achieved only by creating special surface layers Many examples can be given leaf springs with shot peened surfaces carburised and hardened tooth gears coated cutting tips for machining chemical appliances made of glass strengthened by ion exchange enamelled vessels and containers components

for engines or turbines with heat insulating ceramic surface layers chemical equipment made from low carbon steel clad with a layer of stainless steel or other more expensive material endoprostheses of hip joints with ceramic coatings multilayered integrated circuits and other components for electronics and electrotechnology In many of these components high stresses often act from mechanical loading as well as thermal and residual ones caused by the surface treatment itself These stresses can sometimes lead to a failure of parts bearing small or even no load Thus for an efficient utilisation of all the advantages surface treatment offers and for assuring that the designed component will work reliably for a certain period often under very severe conditions it is necessary to know how components with coated or otherwise treated surfaces behave under mechanical loading and what the reasons may be for their preliminary fracture or rejection from service It is also important to know the general principles of design of surface treated components

High Tc Update ,1992 *Coatings Tribology* Kenneth Holmberg, Allan Matthews, 2009-03-18 The surface coating field is a rapidly developing area of science and technology that offers new methods and techniques to control friction and wear New coating types are continually being developed and the potential applications in different industrial fields are ever growing ranging from machine components and consumer products to medical instruments and prostheses This book provides an extensive review of the latest technology in the field addressing techniques such as physical and chemical vapour deposition the tribological properties of coatings and coating characterization and performance evaluation techniques Eleven different cases are examined in close detail to demonstrate the improvement of tribological properties and a guide to selecting coatings is also provided This second edition is still the only monograph in the field to give a holistic view of the subject and presents all aspects including test and performance data as well as insights into mechanisms and interactions thus providing the level of understanding vital for the practical application of coatings An extensive review of the latest developments in the field of surface coatings Presents both theory and practical applications Includes a guide for selecting coatings
