Metamorphic Tectonics Of The Himalaya:

Tectonics of the Himalaya S. Mukherjee, R. Carosi, P.A. van der Beek, B.K. Mukherjee, D.M. Robinson, 2015-09-28 The Himalayan mountain belt which developed during the India Asia collision starting about 55 Ma ago is a dramatically active orogen and it is regarded as the classic collisional orogen. It is characterized by an impressively continuous 2500 km of tectonic units, thrusts and normal faults as well as large volumes of high grade metamorphic rocks and granites exposed at the surface. This constitutes an invaluable field laboratory where amazing crustal sections can be observed directly in very deep gorges. It is possible to unravel the tectonic and metamorphic evolution of litho units to observe the mechanisms of exhumation of deep seated rocks and the propagation of the deformation. Himalayan tectonics has been the target of many studies from numerous international researchers over the years. In the last 15 years there has been an explosion of data and theories from both geological and geophysical perspectives. This book presents the results of integrated multidisciplinary studies including geology, petrology, magmatism, geochemistry, geochronology and geophysics of the structures and processes affecting the continental lithosphere. These processes and their spatial and temporal evolution have major consequences on the geometry and kinematics of the India Eurasia collision zone.

Himalaya: Dynamics of a Giant, Tectonic Units and Structure of the Himalaya Rodolphe Cattin, Jean-Luc Epard, 2023-08-22 The Himalaya is well known as the largest and highest mountain belt on Earth. Advances in geoscience over the past few decades have revealed a complex picture of the dynamics of this giant, opening up questions about the initial stages of Himalayan building, lateral variations in its structures, variations in tectonic forcing, tectonic climate coupling and assessments of the natural hazards affecting this area. In this three volume book we present the current knowledge on the building and present day behavior of the Himalayan range. The objective is not to be exhaustive but to provide some key elements used by researchers to unravel the many processes acting in the Himalayan dynamics. Mountain environments are at the forefront of climate change with glacier retreat, landslides, flash floods and water availability. Understanding the delicate balance that controls the dynamics of the Himalayan giant is now more than ever a major challenge for the scientific community.

Himalayan Tectonics P.J. Treloar, M.P. Searle, 2019-10-08 The Himalaya-Karakoram-Tibet mountain belt resulted from Cenozoic collision of India and Asia and is frequently used as the type example of a continental collision orogenic belt. The last quarter of a century has seen the publication of a remarkably detailed dataset relevant to the evolution of this belt. Detailed fieldwork backed up by state of the art structural analysis, geochemistry, mineral chemistry, igneous and

metamorphic petrology isotope chemistry sedimentology and geophysics produced a wide ranging archive of data rich scientific papers The rationale for this book is to provide a coherent overview of these datasets in addressing the evolution of the mountain ranges we see today This volume comprises 21 specially invited review papers on the Himalaya Kohistan arc Tibet the Karakoram and Pamir ranges These papers span the history of Himalayan research chronology of the collision stratigraphy magmatic and metamorphic processes structural geology and tectonics seismicity geophysics and the evolution of the Indian monsoon This landmark set of papers should underpin the next 25 years of Himalayan research **Geology**

Himalaya and Tibet Allison Macfarlane, Rasoul B. Sorkhabi, Jay Quade, 1999-01-01 **Geology of the Nepal Himalaya** Megh Raj Dhital, 2015-02-11 This book addresses the geology of the entire Himalayan range in Nepal i e from the Gangetic plain in the south to the Tethyan zone in the north Without a comprehensive look at the various Himalayan zones it is practically impossible to fully grasp the processes at work behind the formation and development of the spectacular Himalaya However the goal is not merely to document all the scientific ontology but rather to reveal a sound basis for the prevailing concepts Both the early literature on Himalayan geology and contemporary trends are fully covered For the first time the origin use and abuse of common Himalayan geological terms such as the Siwaliks Lesser Himalaya Main Boundary Thrust Main Central Thrust and Tethys are discussed The book will help readers to progress from a cognitive approach to a constructive one by linking various types of knowledge such as seeking relations between various geological structures as
