An Introduction To Solar Radiation Muhammad Iqbal, 2012-12-02 An Introduction to Solar Radiation is an introductory text on solar radiation with emphasis on the methods of calculation for determining the amount of solar radiation incident on a surface on the earth Topics covered include the astronomical relationship between the sun and the earth thermal radiation the solar constant and its spectral distribution and extraterrestrial solar irradiation This book is comprised of 12 chapters and begins with an overview of the trigonometric relationships between the sun earth line and the position of an inclined surface followed by a discussion on the characteristics of blackbody radiation The next chapter focuses on the solar constant and its spectral distribution paying particular attention to extraterrestrial solar spectral irradiance and the sun's blackbody temperature Subsequent chapters explore extraterrestrial and radiation incident on inclined planes the optics of a cloudless sky atmosphere solar spectral radiation and total broadband radiation under cloudless skies and solar radiation arriving at horizontal surfaces on the earth through cloudy skies The ground albedo and its spectral and angular variation are also described along with insolation on inclined surfaces The last chapter is devoted to instruments for measuring solar radiation including pyrheliometers and pyranometers This monograph will serve as a useful guide for energy analysts designers of thermal devices architects and engineers agronomists and hydrologists as well as senior graduate students

Light Scattering Reviews 4 Alexander A. Kokhanovsky, 2009-07-25 This fourth volume of Light Scattering Reviews is composed of three parts The first part is concerned with theoretical and experimental studies of single light scattering by small nonspherical particles Light scattering by small particles such as for instance droplets in the terrestrial clouds is a well understood area of physical optics On the other hand exact theoretical calculations of light scattering patterns for most of nonspherical and irregularly shaped particles can be performed only for the restricted values of the size parameter which is proportional to the ratio of the characteristic size of the particle to the wavelength For the large nonspherical particles approximations are used e.g. ray optics The exact theoretical techniques such as the T matrix method cannot be used for extremely large particles such as those in ice clouds because then the size parameter in the visible range is the characteristic size radius for spheres and the associated numerical codes become unstable and produce wrong answers Yet another problem is due to the fact that particles in many turbid media e.g. dust clouds cannot be characterized by a single shape Often refractive indices also vary Because of problems with theoretical calculations experimental laboratory investigations are important for the characterization and understanding of the optical properties of such types of particles The first paper in this volume written by B. Gustafson is aimed at the description of scaled analogue experiments in electromagnetic scattering

Short-Wave Solar Radiation in the Earth's

Atmosphere Irina N. Melnikova, Alexander V. Vasilyev, 2005 Based on data from an experiment which ran for ten years this

book summarizes the results of the Atmospheric Physics Department of the St Petersburg University and the Main Geophysical Observatory The processed data now forms a rich dataset of spectral values of radiative characteristics under different atmospheric conditions The analysis of this database clearly shows that the solar radiative absorption in a dusty and cloudy atmosphere is significantly higher than assumed to date Both graduate students of atmospheric sciences as well as scientists and researchers in the field of meteorology and climatology will find a wealth of new data and information in this monograph
