Seed Biology And The Yield Of Grain Crops:

Seed Biology and Yield of Grain Crops, 2nd Edition Dennis B Egli, 2017-02-23 This new edition of an established title examines the determination of grain crop yield from a unique perspective by concentrating on the influence of the seed itself. As the food supply for an expanding world population is based on grain crops harvested for their seeds, understanding the process of seed growth and its regulation is crucial to our efforts to increase production and meet the needs of that population. Yield of grain crops is determined by their assimilatory processes such as photosynthesis and the biosynthetic processes in the seed which are partly regulated within the seed itself. Substantially updated with new research and further developments of the practical applications of the concepts explored, this book is essential reading for those concerned with seed science and crop yield, including agronomists, crop physiologists, plant breeders and extension workers. It is also a valuable source of information for lecturers and graduate students of agronomy and plant physiology.

Wheat in a Global Environment Z. Bedo, L. Láng, 2013-06-29 Wheat breeders have achieved significant results over the last fifty years in research on mankind's one of the most important crops Classical genetic and breeding methods far broader international cooperation than was experienced in earlier periods and improvements in agronomic techniques have led to previously unimaginable development

in the utilisation of wheat for human consumption The contribution of wheat researchers is particularly noteworthy since these results have been achieved at a time when the world population has grown extremely dynamically Despite this demographic explosion of a proportion never previously experienced thousands of millions of people have been saved from starvation thus avoiding unpredictable social consequences and situations irreconcilable with human dignity Despite these developments in many regions of the world food supplies are still uncertain and the increase in the world's wheat production has not kept pace with the population increase during the last decade Due to the evils of civilisation and the pollution of the environment there is a constant decline in the per capita area of land suitable for agricultural production Based on population estimates for 2030 the present wheat yield of around 600 million tonnes will have to be increased to almost 1000 million tonnes if food supplies are to be maintained at the present level
