**Analog Layout Generation for Performance and Manufacturability** Koen Lampaert, Georges Gielen, Willy M.C. Sansen, 2013-04-18 Analog integrated circuits are very important as interfaces between the digital parts of integrated electronic systems and the outside world A large portion of the effort involved in designing these circuits is spent in the layout phase Whereas the physical design of digital circuits is automated to a large extent the layout of analog circuits is still a manual time consuming and error prone task This is mainly due to the continuous nature of analog signals which causes

analog circuit performance to be very sensitive to layout parasitics. The parasitic elements associated with interconnect wires cause loading and coupling effects that degrade the frequency behaviour and the noise performance of analog circuits. Device mismatch and thermal effects put a fundamental limit on the achievable accuracy of circuits. For successful automation of analog layout, advanced place and route tools that can handle these critical parasitics are required. In the past, automatic analog layout tools tried to optimize the layout without quantifying the performance degradation introduced by layout parasitics. Therefore, it was not guaranteed that the resulting layout met the specifications and one or more layout iterations could be needed. In *Analog Layout Generation for Performance and Manufacturability*, the authors propose a performance-driven layout strategy to overcome this problem. In this methodology, the layout tools are driven by performance constraints such that the final layout with parasitic effects still satisfies the specifications of the circuit. The performance degradation associated with an intermediate layout solution is evaluated at runtime using predetermined sensitivities. In contrast with other performance-driven layout methodologies, the tools proposed in this book operate directly on the performance constraints without an intermediate parasitic constraint generation step. This approach makes a complete and sensible trade-off between the different layout alternatives possible at runtime and therefore eliminates the possible feedback route between constraint derivation, placement and layout extraction. Besides its influence on the performance layout, it also has a profound impact on the yield and testability of an analog circuit. In *Analog Layout Generation for Performance and Manufacturability*, the authors outline a new criterion to quantify the detectability of a fault and combine this with a yield model to evaluate the testability of an integrated circuit layout. They then integrate this technique with their performance-driven routing algorithm to produce layouts that have optimal manufacturability while still meeting their performance specifications. *Analog Layout Generation for Performance and Manufacturability* will be of interest to analog engineers, researchers and students.

**Software Product Lines** Patrick Donohoe, 2012-12-06 Software product lines are emerging as a critical new paradigm for software development. Product lines are enabling organizations to achieve impressive time to market gains and cost reductions. With the increasing number of product lines, and product line researchers and practitioners, the time is right for a comprehensive examination of the issues surrounding the software product line approach. The Software Engineering Institute at Carnegie Mellon University is proud to sponsor the first conference on this important subject. This book comprises the proceedings of the First Software Product Line Conference (SPLC1) held August 28-31, 2000 in Denver, Colorado, USA. The twenty-seven papers of the conference technical program present research results and experience reports that cover all aspects of software product lines. Topics include business issues, enabling technologies, organizational issues, and life cycle issues. Emphasis is placed on experiences in the development and fielding of product lines of complex systems, especially those that expose problems in the design, development or evolution of software product lines.
