Reliability and Statistics in Geotechnical Engineering Gregory B. Baecher, John T. Christian, 2005-08-19 Risk and reliability analysis is an area of growing importance in geotechnical engineering where many variables have to be considered. Statistics, reliability modeling and engineering judgement are employed together to develop risk and decision analyses for civil engineering systems. The resulting engineering models are used to make probabilistic predictions which are applied to geotechnical problems. Reliability Statistics in Geotechnical Engineering comprehensively covers the subject of risk and reliability in both practical and research terms. Includes extensive use of case studies. Presents topics not covered elsewhere: spatial variability and stochastic properties of geological materials. No comparable texts available. Practicing engineers will find this an essential resource as will graduates in geotechnical engineering programmes.

Family and Population Changes in Singapore Wei-Jun Jean Yeung, Shu Hu, 2018-04-17 This book depicts the evolution of Singapore's family and population landscape in the last half a century, the related public policies and future challenges. Since the country gained independence in 1965, family and population policies have been integral to her nation building strategies. The chapters discuss the changes in population compositions, family structures, relations and values among major ethnic groups. They also discuss policies for vulnerable populations such as female headed households, cross cultural families, same sex partnering, the elderly and low income families.

Handbook of Environmental and Ecological Statistics Alan E. Gelfand, Montserrat Fuentes, Jennifer A. Hoeting, Richard Lyttleton Smith, 2019-01-15 This handbook focuses on the enormous literature applying statistical methodology and modelling to environmental and ecological processes. The 21st century statistics community has become increasingly interdisciplinary, bringing a large collection of modern tools to all areas of application in environmental processes. In addition, the environmental community has substantially increased its scope of data collection, including observational data, satellite derived data and computer model output. The resultant impact in this latter community has been substantial; no longer are simple regression and analysis of variance methods adequate. The contribution of this handbook is to assemble a state of the art view of this interface. Features: An internationally regarded editorial team. A distinguished collection of contributors. A thoroughly contemporary treatment of a substantial interdisciplinary interface. Written to engage both statisticians as well as quantitative environmental researchers. 34 chapters covering methodology, ecological processes, environmental exposure and statistical methods in climate science.

Econometrics Volume 1: Basic Theory And Topics For Cross-section Data Pierre Perron, 2025-08-26 This book is intended for graduate instruction in subjects like econometrics, economics, environmental science, social science and many other fields at the Masters or PhD levels. It can be used as a textbook or as a reference guide. It covers a wide range of topics related to tools used in cross sectional time series and panel data. There are several aspects in which this book departs from traditional treatments. The emphasis is on understanding the main issues, concepts and methods in Econometrics, how to implement them and interpret the results. The

mathematical aspects are kept to a minimum as the aim is to provide an intuitive understanding of how various parts fit together as opposed to a sophisticated mathematical treatment of the subject Many examples and discussions are provided Hence minimal mathematical pre requisites are needed Extensive references are also provided to dig deeper into the mathematical aspects of the theories Volume 1 deals with the main methods used for inference and hypothesis testing which are applicable to both time series and cross section data within a unified framework with special emphasis on how the conditions and methods differ for each It also includes a discussion of methods applicable only to a cross section of data usually a random sample and to panel data with a small time dimension Cases with a large number of predictors are also covered

An Introduction to Statistical Modeling of Extreme Values Stuart Coles, 2013-11-27 Directly oriented towards real practical application this book develops both the basic theoretical framework of extreme value models and the statistical inferential techniques for using these models in practice Intended for statisticians and non statisticians alike the theoretical treatment is elementary with heuristics often replacing detailed mathematical proof Most aspects of extreme modeling techniques are covered including historical techniques still widely used and contemporary techniques based on point process models A wide range of worked examples using genuine datasets illustrate the various modeling procedures and a concluding chapter provides a brief introduction to a number of more advanced topics including Bayesian inference and spatial extremes All the computations are carried out using S PLUS and the corresponding datasets and functions are available via the Internet for readers to recreate examples for themselves An essential reference for students and researchers in statistics and disciplines such as engineering finance and environmental science this book will also appeal to practitioners looking for practical help in solving real problems Stuart Coles is Reader in Statistics at the University of Bristol UK having previously lectured at the universities of Nottingham and Lancaster In 1992 he was the first recipient of the Royal Statistical Society's research prize He has published widely in the statistical literature principally in the area of extreme value modeling

Prior Processes and Their Applications Eswar G. Phadia, 2016-07-27 This book presents a systematic and comprehensive treatment of various prior processes that have been developed over the past four decades for dealing with Bayesian approach to solving selected nonparametric inference problems This revised edition has been substantially expanded to reflect the current interest in this area After an overview of different prior processes it examines the now pre eminent Dirichlet process and its variants including hierarchical processes then addresses new processes such as dependent Dirichlet local Dirichlet time varying and spatial processes all of which exploit the countable mixture representation of the Dirichlet process It subsequently discusses various neutral to right type processes including gamma and extended gamma beta and beta Stacy processes and then describes the Chinese Restaurant Indian Buffet and infinite gamma Poisson processes which prove to be very useful in areas such as machine learning information retrieval and featural modeling Tailfree and Polya tree and their extensions form a separate chapter while the last two chapters present the Bayesian

solutions to certain estimation problems pertaining to the distribution function and its functional based on complete data as well as right censored data. Because of the conjugacy property of some of these processes most solutions are presented in closed form. However the current interest in modeling and treating large scale and complex data also poses a problem the posterior distribution which is essential to Bayesian analysis is invariably not in a closed form making it necessary to resort to simulation. Accordingly the book also introduces several computational procedures such as the Gibbs sampler Blocked Gibbs sampler and slice sampling highlighting essential steps of algorithms while discussing specific models. In addition it features crucial steps of proofs and derivations explains the relationships between different processes and provides further clarifications to promote a deeper understanding. Lastly it includes a comprehensive list of references equipping readers to explore further on their own.

An Asian Direct and Indirect Real Estate Investment Analysis Kim Hin David

HO, 2021-05-04 This book is dedicated to real estate scholastic work in advancing the greater understanding of real estate investment analysis. This is because there has been limited research in bringing out clearly the uncertainty or risk which is quantifiable uncertainty in real estate market analysis. Even real estate market research which is carried out as an industry practice among private real estate researches is no exception. Another reason is that it has been widely accepted that while the financial revolution has substantially changed many sectors of the financial industry it has made little impact on real estate development and investment practice as well as scholastic work. Furthermore while it is readily acknowledged that despite its huge share in the world real estate investment discipline and research is on the whole still a poorly researched subject area. As a result the industry tends to be dominated by traditional real estate analysts with little understanding of real estate market uncertainty and capital markets. These commentators are widely regarded to spend too much time worrying about local space supply and demand conditions while totally losing sight of the everchanging real estate market and capital market conditions. The theme of this book is real estate investment analysis of direct and indirect real estate which in turn can be appropriately managed under economic theory and the theoretical conceptions of real estate finance provided the uncertainty is quantifiable. The book deploys case studies involving Singapore and Asia. This Black over White background viii framework enables real estate market analysis to attempt what defines the Asian direct and indirect real estate sectors what is being measured how it behaves in terms of price and non price factors how it is structured and how it effectively achieves the objectives of sustainable total returns and manageable real estate market uncertainty. Managing real estate market uncertainty optimally is achieved at the portfolio level through real estate asset allocation. This is important because the real estate portfolio is able to virtually eliminate the unique i.e. specific uncertainties among the various Asian real estate sectors thus retaining within the portfolio only the systemic i.e. market wide uncertainty. Apart from real estate asset allocation the alternative and modern approach to risk management at the portfolio level is the value at risk VaR approach. Another modern and important alternative to coping with uncertainty is real option analysis and pricing that help

to better define real estate market uncertainty in extent and time Real option analysis and pricing also represent uncertainty via a decision tree and the risk neutral probability conception in order to comprehend how uncertainty impacts on the value of real estate investment decisions The pricing of uncertainty is based on the risk free hedge security conception These are best examined at the micro level of the investment in a real estate development opportunity on vacant land Nevertheless the real estate sectors in Singapore and Asia offer promising prospects since the Asian currency crisis of 1997 It is now timely to take stock and make an assessment of how the sectors would pan out for the future Ill into at least rest the next century I are very pleased to present our thinking and research in international real estate with particular emphasis on Asia The region s vast potential for real estate is itself a large incentive for international real estate research and education that has inspired me to document the significant work I have done over the years Black over White background ix I wish all readers a pleasurable reading of this book and I thank you sincerely for your support without which the publication of this book would be made all the more difficult Dr HO Kim Hin David Honorary Professor University of Hertfordshire UK International Real Estate Public Policy March 2021

Mathematics Curriculum in Pacific Rim Countries - China, Japan, Korea, and Singapore Zalman Usiskin, Edwin Willmore, 2008-09-01 This volume contains the proceedings of the First International Curriculum Conference sponsored by the Center for the Study of Mathematics Curriculum CSMC The CSMC is one of the National Science Foundation Centers for Learning and Teaching Award No ESI 0333879 The countries China Japan Korea and Singapore in alphabetical order which also happens to be the order of their populations have each been in the news because of their performance on international tests and or their economic performance and potential They also have centralized education ministries that create a single mathematics curriculum framework followed in the entire country In all these countries curricula are differentiated for students with different interests usually around Grade 10 or 11 We think the reader will agree that the papers are of very high quality befitting the standing of the individuals who were invited but particularly notable for our international speakers because in three of these countries English is not the speaker s first language Following each paper we have included a short biography of the author s so that the reader can understand the perspective of the paper s author

Demography: Analysis and Synthesis, Four Volume Set Graziella Caselli, Jacques Vallin, Guillaume Wunsch, 2006-01-03 This four volume collection of over 140 original chapters covers virtually everything of interest to demographers sociologists and others Over 100 authors present population subjects in ways that provoke thinking and lead to the creation of new perspectives not just facts and equations to be memorized The articles follow a theory methods applications approach and so offer a kind of one stop shop that is well suited for students and professors who need non technical summaries such as political scientists public affairs specialists and others Unlike shorter handbooks Demography Analysis and Synthesis offers a long overdue thorough treatment of the field Choosing the analytical method that fits the data and the situation requires insights that the authors and editors of Demography Analysis and Synthesis have

explored and developed This extended examination of demographic tools not only seeks to explain the analytical tools themselves but also the relationships between general population dynamics and their natural economic social political and cultural environments Limiting themselves to human populations only the authors and editors cover subjects that range from the core building blocks of population change fertility mortality and migration to the consequences of demographic changes in the biological and health fields population theories and doctrines observation systems and the teaching of demography The international perspectives brought to these subjects is vital for those who want an unbiased rounded overview of these complex multifaceted subjects Topics to be covered Population Dynamics and the Relationship Between Population Growth and Structure The Determinants of Fertility The Determinants of Mortality The Determinants of Migration Historical and Geographical Determinants of Population The Effects of Population on Health Economics Culture and the Environment Population Policies Data Collection Methods and Teaching about Population Studies All chapters share a common format Each chapter features several cross references to other chapters Tables charts and other non text features are widespread Each chapter contains at least 30 bibliographic citations Low and Lower Fertility Ronald R. Rindfuss, Minja Kim Choe, 2015-10-12 This volume examines two distinct low fertility scenarios that have emerged in economically advanced countries since the turn of the 20th century one in which fertility is at or near replacement level and the other where fertility is well below replacement It explores the way various institutions histories and cultures influence fertility in a diverse range of countries in Asia Europe North America and Australia The book features invited papers from the Conference on Low Fertility Population Aging and Population Policy held December 2013 and co sponsored by the East West Center and the Korea Institute for Health and Social Affairs KIHASA It first presents an overview of the demographic and policy implications of the two low fertility scenarios Next the book explores five countries currently experiencing low fertility rates China Hong Kong Japan Singapore and South Korea It then examines three countries that have close to replacement level fertility Australia the Netherlands and the United States Each country is featured in a separate chapter written by a demographer with expert knowledge in the area Very low fertility is linked to a number of conditions countries face including a declining population size At the same time low fertility and its effect on the age structure threatens social welfare policies This book goes beyond the technical to examine the core institutional policy and cultural factors behind this increasingly important issue It helps readers to make cross country comparisons and gain insight into how diverse institutions policies and culture shape fertility levels and patterns
