Molecular Basis Of Biological Degradative Processes:

Molecular Basis of Biological Degradative processes Richard Berlin, 2012-12-02 Molecular Basis of Biological Degradative Processes contains the proceedings of the 1977 symposium held at the University of Connecticut Health Science Center. The papers focus on the molecular mechanisms underlying the biological degradation, including the relationship between the lysosome and tissue remodeling and the role of this organelle in processing intra and extracellular material. The book also explores the specific application of the lysosome concept to the description of deficiency diseases of lipid catabolism. Organized into 12 chapters, this book begins with an overview of the mechanisms underlying cell death and its control, along with possible experimental models for its study: nutrient deficiencies during prenatal development and congenital diseases resulting from zinc, magnesium, and manganese deficiencies. It explains the clinical lysosome deficiencies, the early phase of blood coagulation cascade events in the activation and function of mast cells, activation of plasminogen and its involvement in the production of localized extracellular proteolysis and proteolytic events in viral replication. Chapters on human neutrophil elastase and the protease pathogenesis model of pulmonary emphysema, dissolution mechanism of apatite crystals during dental caries and bone resorption, and degradative processes of bone follow. This book is a valuable resource for biologists, physiologists, and those involved in basic and applied research in catabolic processes. Molecular Basis of Biological

Degradative Processes ,1978 *Mechanisms of Differentiation* Paul B. Fisher,1990-08-27 Significant recent advances in cell culture technology now permit a detailed biochemical and molecular analysis of differentiation in both normal and tumor cells These studies are important in attempting to understand the complex factors involved in normal growth and development as well as the abnormalities associated with carcinogenesis *Mechanisms of Differentiation* Volumes I and II is comprised of review chapters addressing various topics of current interest in this important area of research Topics discussed include genes controlling differentiation changes in gene expression during differentiation induction of differentiation induction of differentiation as a mode of action of chemotherapeutic agents and the effect of cell shape growth factors and differentiation modulating agents on the differentiated cell phenotype *Mechanisms of Differentiation* is valuable to researchers involved in differentiation and development carcinogenesis cell biology chemotherapy and immunology □□

Protein Degradation in Health and Disease David Evered, Julie Whelan, 2009-09-14 The Novartis Foundation Series is a popular collection of the proceedings from Novartis Foundation Symposia in which groups of leading scientists from a range of topics across biology chemistry and medicine assembled to present papers and discuss results The Novartis Foundation originally known as the Ciba Foundation is well known to scientists and clinicians around the world [Handbook of Immunochemistry](#) Miroslav Ferencik, 2012-12-06 The book appeared in two previous Slovak editions for university students in Czechoslovakia This edition presents a completely new version updated according to recent advances not only in

immunochemistry and essential immunology but also in molecular biology biochemistry and molecular genetics The scope of the book is considerable since the goal was to cover the field of immunochemistry from the widest point of view including both the topic and methods of contemporary immunochemistry Each chapter provides basic information on a specific subtopic clearly and understandably and presents principles of individual immunochemical methods I am confident that the book will fill the gap between the books on essential immunology and highly specialised books on individual areas of immunochemistry e.g. on antibodies antigens numerous immunochemical techniques etc It may also prove useful for beginning investigators from different biological and medical fields as it supplies basic information needed for solving their scientific problems by immunochemical approaches I do hope that readers will find the text stimulatory and a pleasure to read I wish to thank all colleagues and friends for supplying their own results suggestions and for their encouraging comments My thanks go also to the editors and publishers for their valuable contribution to the preparation of the book

1 Introduction The term immunochemistry was coined by the Swedish chemist ARRHENIUS who used it for the first time in his lectures in 1907

New Trends in Haemostasis Job Harenberg, Dieter L. Heene, Gerd Stehle, Gotthard Schettler, 2012-12-06 To give an update in the field of haemostasis scientists and clinicians from overseas and European countries met to discuss the new trends in pathophysiology and clinical implications This book is devoted to the interactions of endothelial functions tissue factors coagulation inhibitors and haemostasis as well as detection and prophylaxis of thromboembolism Data are presented of significant new research work on molecular and clinical approaches to diseases in haemostasis

The Biorganic Chemistry of Enzymatic Catalysis Valerian T. D'Souza, Joseph Feder, 1991-12-10 This volume grew out of a symposium organized by the students of Professor Myron L Bender His research focused on the mechanisms of enzymatic catalysis and was instrumental in showing that enzymes do not possess magical powers to accelerate reactions a trillion times on an average but follow simple rules of chemistry A group of scientists who were trained by Bender have contributed some of their work to this book to pay homage to their mentor The range of topics covered is such that researchers and industry with interest in biological chemistry will gain knowledge from the advances being made in related fields The book shows organic chemists what advances have taken place in biological chemistry and biochemists will discover how principles of organic chemistry can be applied to reveal the powers of enzymatic catalysis

Mechanisms of Cancer Metastasis Kenneth V. Honn, William E. Powers, Bonnie F. Sloane, 2012-12-06

The past twenty years have witnessed significant advances in the treatment of cancer by surgery and radiation therapy. Gains with cytotoxic chemotherapy have been much more modest. Of the approximately 900 000 newly diagnosed cases of cancer each year 50010 result in death of the patient. The primary cause of these deaths is metastasis. Although the term metastasis was first coined by Recamier in 1829 only in the past ten years have there been intensive scientific investigations into the mechanisms by which tumor cells metastasize. What has emerged is a complex process of host tumor cell interactions which has been termed the metastatic cascade. Due to the complexity of the metastatic process the study of metastasis is multifaceted and involves elements of such areas as differentiation, enzymology, genetics, hematology, immunology, membrane biochemistry and molecular biology. The major objectives of this book were to present the most recent advances in our understanding of how tumor cells metastasize to secondary sites by the leading experts in the biology of tumor invasion and metastasis. We hope that this book will lead to new concepts for the treatment of subclinical metastatic cancer. The chapters in this book address both the basic science of metastasis and potential clinical therapies directed toward interruption of the metastatic cascade or toward eradication of subclinical metastases. Many relevant topics have been omitted due to space considerations and thus the topics included reflect the prejudices of the editors.

The Prostate as an Endocrine Gland Richard J. Ablin, Wells E. Farnsworth, 1989-11-30

This unique publication illustrates that the prostate elaborates an array of local hormones or autoids and how these influence prostatic growth function and oncogenesis. It describes how familiarity with these participants and how they effect the character and direction of prostatic function may suggest diagnostic markers of malfunction and new sites and modes of therapeutic intervention. The catholic scope and authorship of the work seeks to integrate the views of those urologists, reproductive physiologists and endocrinologists who presently work with the prostate. It attempts to show all other biologists the full range of the gland's activities and participating molecules. Included are oncogenes, mitogens, polyamines, prostaglandins, growth factors, antigens and the familiar steroid, peptide and protein hormones. This volume is unique in its point of view and in the new concepts it presents. Addressed are actions of spermine binding protein and osteoblastic mitogens, consequences of inhibin, thyrotropin releasing hormone, balance and urokinase effects. Covered also are androgen modulation of vasoactive intestinal polypeptides, evidence of a prostatic lymphoreticular system, secretion of dihydrotestosterone and a model of the interdependence of prostatic epithelium and stroma. This unique new volume is of great value to those in urology, internal medicine, physiology, endocrinology and pharmacology.

Vision: Structure And Function Kwok-fai So, David Tai Wai Yew, David Sau Cheuk Tsang, 1988-05-01

This volume consists of invited papers from scientists of Chinese origin in the visual field from around the

world The papers cover all basic and applied aspects of the vertebrate and invertebrate visual systems from photoreceptors to cortical neurons presenting both review and new findings on the subjects It is hoped that this book will serve as a guide to international research linkage between groups *Annual Research Progress Report - US Army Institute of Surgical Research* ,1981 Control of Enzyme Activity P. Cohen,2013-03-07 The student of biological science in his final years as an undergraduate and his first years as a graduate is expected to gain some familiarity with current research at the frontiers of his discipline New research work is published in a perplexing diversity of publications and is inevitably concerned with the minutiae of the subject The sheer number of research journals and papers also causes confusion and difficulties of assimilation Review articles usually presuppose a background knowledge of the field and are inevitably rather restricted in scope There is thus a need for short but authoritative introductions to those areas of modern biological research which are either not dealt with in standard introductory textbooks or are not dealt with in sufficient detail to enable the student to go on from them to read scholarly reviews with profit This series of books is designed to satisfy this need The authors have been asked to produce a brief outline of their subject assuming that their readers will have read and remembered much of a standard introductory textbook of biology *Advances in Cancer Research* ,1985-07-23 *Advances in Cancer Research*
