Aerodynamic Deployable Decelerator Performance-Evaluation Program E. Bloetscher, 1967 The Aerodynamic Deployable Decelerator Performance Evaluation Program ADDPEP aims to advance the state of the art by developing the most effective analytical and empirical techniques for designing aerodynamic deployable decelerators and for evaluating these engineering techniques through wind tunnel and free flight tests During ADDPEP Phase 2 two types of decelerators were investigated large reefed supersonic parachutes and ram-inflated balloon type BALLUTES The areas investigated included analytical and engineering design material capabilities fabrication techniques and wind tunnel and free flight tests Free flight tests were performed on a hemispherical parachute having a nominal 16 ft diameter canopy a 10 percent extended skirt and a 14 percent porosity This design was tested for 200 000 lb opening loads deployment Mach numbers were 1.50 1.63 and 1.84 at altitudes of 13 700 15 500 and 10 500 ft respectively The results confirmed that this parachute has excellent aerodynamic characteristics and adequate strength Five foot diameter BALLUTES both textile and metal were fabricated These were designed for a broad spectrum of deployment conditions ranging from Mach 2.7 at 73 000 ft to Mach 10 at 225 000 ft The textile BALLUTES were wind tunnel and free flight tested the metal BALLUTES were wind tunnel tested only Flight tests were limited to Mach 9.7 and wind

tunnel tests to Mach 3 The flight test data supported wind tunnel data which indicated that excellent stability and structurally adequate designs can be attained with five foot diameter BALLUTES **FCC Record** United States. Schettler,Y. Goto,Y. Hata,G. Klose,2012-12-06 The presence of monotypism in thick atherosclerotic lesions of black females with G 6 PD mosaicism first reported by the Benditts 1973 has been confirmed in two other laboratories However we believe that it is premature to conclude that the finding of monotypism necessarily indicates monoclonal origin of atherosclerotic lesions We have suggested two alternative explanations for the observation of monotypism which we believe must be shown to be invalid before accepting monoclonal origin as the only plausible way to account for the observed G 6 PD monotypism One of these two alternatives relates to clonal heterogeneity of cell growth potential i e during the course of progressive growth of a lesion progeny of one cell may overgrow all others in a portion of the lesion The other alternative is that one of the G 6 PD alleles may be linked to genes that afford a preferential survival characteristic in the abnormal environment present in atherosclerotic lesions Thus cells with one allele may be able to grow better than cells with the other allele and this characteristic may be unrelated to A-ness or B-ness We have studied initiation of lesions in He diet fed swine and demonstrated that all active lesions that were studied were of multiple cell origin not monoclonal We have studied cell growth patterns in developing atherosclerotic lesions in He diet fed swine and found evidence consistent with clonal heterogeneity in growth potential of lesion cells *History of Logan County, Illinois, Together with Sketches of Its Cities, Villages, and Towns, Educational, Religious, Civil, Military, and Political History, Portraits of Prominent Person, and Biographies of Representative Citizens* ,1886
