Pathways to Speech Rhoderick J. Elin,1973 **Human Language** Peter Hagoort,2019-10-29 A unique overview of the human language faculty at all levels of organization Language is not only one of the most complex cognitive functions that we command it is also the aspect of the mind that makes us uniquely human Research suggests that the human brain exhibits a language readiness not found in the brains of other species This volume brings together contributions from a range of fields to examine humans language capacity from multiple perspectives analyzing it at genetic neurobiological psychological and linguistic levels In recent decades advances in computational modeling neuroimaging and genetic sequencing have made possible new approaches to the study of language and the contributors draw on these developments The book examines cognitive architectures investigating the functional organization of the major language skills learning and development trajectories summarizing the current understanding of the steps and neurocognitive mechanisms in language processing evolutionary and other preconditions for communication by means of natural language computational tools for modeling language cognitive neuroscientific methods that allow observations of the human brain in action including fMRI EEG MEG and others the neural infrastructure of language capacity the genome s role in building and maintaining the language ready brain and insights from studying such language relevant behaviors in nonhuman animals as birdsong and primate vocalization Section editors Christian F Beckmann Carel ten Cate Simon E Fisher Peter Hagoort Evan Kidd Stephen C Levinson James M McQueen Antje S Meyer David Poeppel Caroline F Rowland Constance Scharff Ivan Toni Willem Zuidema **Singing Excellence and How to Acheive It** Dr. James Myron Holland Ph.D.,James Myron Holland,2012-08-27 Your exciting book on singing presents wonderful new ideas and these principles have obviously proven themselves many times over I congratulate you for the important work you have accomplished in this splendid book Jo Ann Ottley prima donna soprano Emeritus Utah Opera Co for it is an Elijah s chariot to heaven of vocal power effciency facility and magnificence Dr John T Mize past President of the Assoc of American Musicologists and it ought to be found in every major opera house and School of Music in America and throughout the world Maestro Michael Ballam a Doctor of Music with Distinction D Mus D General Director of Utah Festival Opera Co I shall consume your brilliant treatise on singing with utmost enthusiasm It is a great and monumental albeit heretical masterpiece Lester Morris Australian tenor Impresario Artistic Director of the Rockdale Opera Co **The Oxford Handbook of Neurolinguistics** Greig I. de Zubicaray,Niels O. Schiller,2019-03-01 Neurolinguistics is a young and highly interdisciplinary field with influences from psycholinguistics psychology aphasiology and cognitive neuroscience as well as other fields Neurolinguistics like psycholinguistics covers aspects of language processing but unlike psycholinguistics it draws on data from patients with damage to language processing capacities or the use of modern neuroimaging technologies such as fMRI TMS or both The burgeoning interest in neurolinguistics reflects that an understanding of the neural bases of this data can inform more biologically plausible models of the human capacity for

language The Oxford Handbook of Neurolinguistics provides concise overviews of this rapidly growing field and engages a broad audience with an interest in the neurobiology of language The chapters do not attempt to provide exhaustive coverage but rather present discussions of prominent questions posed by given topics The volume opens with essential methodological chapters Section I Methods covers the key techniques and technologies used to study the neurobiology of language today with chapters structured along the basic divisions of the field Section II addresses the neurobiology of language acquisition during healthy development and in response to challenges presented by congenital and acquired conditions Section III covers the many facets of our articulate brain or speech language pathology and the capacity for language production written spoken and signed Questions regarding how the brain comprehends meaning including emotions at word and discourse levels are addressed in Section IV Finally Section V reaches into broader territory characterizing and contextualizing the neurobiology of language with respect to more fundamental neuroanatomical mechanisms and general cognitive domains

Bernstein,2017-05-03 Perceptual categorization is fundamental to the brain s remarkable ability to

process large amounts of sensory information and efficiently recognize objects including speech Perceptual categorization is the neural bridge between lower level sensory and higher level language processing A long line of research on the physical properties of the speech signal as determined by the anatomy and physiology of the speech production apparatus has led to descriptions of the acoustic information that is used in speech recognition e g stop consonants place and manner of articulation voice onset time aspiration Recent research has also considered what visual cues are relevant to visual speech recognition i e the visual counter parts used in lipreading or audiovisual speech perception Much of the theoretical work on speech perception was done in the twentieth century without the benefit of neuroimaging technologies and models of neural representation Recent progress in understanding the functional organization of sensory and association cortices based on advances in neuroimaging presents the possibility of achieving a comprehensive and far reaching account of perception in the service of language At the level of cell assemblies research in animals and humans suggests that neurons in the temporal cortex are important for encoding biological categories On the cellular level different classes of neurons interneurons and pyramidal neurons have been suggested to play differential roles in the neural computations underlying auditory and visual categorization The moment is ripe for a research topic focused on neural mechanisms mediating the emergence of speech representations including auditory visual and even somatosensory based forms Important progress can be achieved by juxtaposing within the same research topic the knowledge that currently exists the identified lacunae and the theories that can support future investigations This research topic provides a snapshot and platform for discussion of current understanding of neural mechanisms underlying the formation of perceptual categories and their relationship to language from a multidisciplinary and multisensory perspective It includes contributions reviews original research methodological developments pertaining to the neural substrates dynamics and mechanisms underlying perceptual categorization and their interaction with neural processes governing speech perception **Genomics, Circuits, and Pathways in Clinical Neuropsychiatry** Thomas Lehner,Bruce L.
