Selected Papers of E. B. Dynkin with Commentary Evgenii Borisovich Dynkin, Gary M. Seitz, 2000 Eugene Dynkin is a rare example of a contemporary mathematician who has achieved results in two quite different areas of research algebra and probability In both areas his ideas constitute an essential part of modern mathematical knowledge and form a basis for further development Although his last work in algebra was published in 1955 his contributions continue to influence current research in algebra and in the physics of elementary particles His work in probability is part of both the historical and the modern development of the topic **Distribution Modulo One and Diophantine Approximation** Yann

Bugeaud, 2012-07-05 This book presents state of the art research on the distribution modulo one of sequences of integral powers of real numbers and related topics Most of the results have never before appeared in one book and many of them were proved only during the last decade Topics covered include the distribution modulo one of the integral powers of 3 2 and the frequency of occurrence of each digit in the decimal expansion of the square root of two The author takes a point of view from combinatorics on words and introduces a variety of techniques including explicit constructions of normal numbers Schmidt's games Riesz product measures and transcendence results With numerous exercises the book is ideal for graduate courses on Diophantine approximation or as an introduction to distribution modulo one for non experts Specialists will appreciate the inclusion of over 50 open problems and the rich and comprehensive bibliography of over 700 references

Seminaire de Probabilites XXXI Jacques Azema, Michel Emery, Marc Yor, 2008-05-01 The 31 papers collected here present original research results obtained in 1995 96 on Brownian motion and more generally diffusion processes martingales Wiener spaces polymer measures *Selected Works of E. L. Lehmann* Javier Rojo, 2012-01-14 These volumes present a selection of Erich L Lehmann's monumental contributions to Statistics These works are multifaceted His early work included fundamental contributions to hypothesis testing theory of point estimation and more generally to decision theory His work in

Nonparametric Statistics was groundbreaking His fundamental contributions in this area include results that came to assuage the anxiety of statisticians that were skeptical of nonparametric methodologies and his work on concepts of dependence has created a large literature The two volumes are divided into chapters of related works Invited contributors have critiqued the papers in each chapter and the reprinted group of papers follows each commentary A complete bibliography that contains links to recorded talks by Erich Lehmann and which are freely accessible to the public and a list of Ph D students are also included These volumes belong in every statistician s personal collection and are a required holding for any institutional library

Probability, Combinatorics and Control Andrey Kostogryzov,Victor Korolev,2020-04-15 Probabilistic and combinatorial techniques are often used for solving advanced problems This book describes different probabilistic modeling methods and their applications in various

areas such as artificial intelligence offshore platforms social networks and others It aims to educate how modern probabilistic and combinatorial models may be created to formalize uncertainties to train how new probabilistic models can be generated for the systems of complex structures to describe the correct use of the presented models for rational control in systems creation and operation and to demonstrate analytical possibilities and practical effects for solving different system problems on each life cycle stage *Subject Guide to Books in Print* ,1993 Branching Processes Krishna B. Athreya, Peter E. Ney, 2012-12-06 The purpose of this book is to give a unified treatment of the limit theory of branching processes Since the publication of the important book of T E Harris *Theory of Branching Processes* Springer 1963 the subject has developed and matured significantly Many of the classical limit laws are now known in their sharpest form and there are new proofs that give insight into the results Our work deals primarily with this decade and thus has very little overlap with that of Harris Only enough material is repeated to make the treatment essentially self contained For example certain foundational questions on the construction of processes to which we have nothing new to add are not developed There is a natural classification of branching processes according to their criticality condition their time parameter the single or multi type particle cases the Markovian or non Markovian character of the process etc We have tried to avoid the rather uneconomical and unenlightening approach of treating these categories independently and by a series of similar but increasingly complicated techniques The basic Galton Watson process is developed in great detail in Chapters I and II
