Structure and Architecture Angus J Macdonald, 2007-06-07

Structure and Architecture is an essential textbook for students and practitioners of architecture and structural engineering MacDonald explains the basic principles of structure and describes the ranges of structure types in current use Furthermore the book links these topics directly with the activity of architectural design and criticism An update of the first edition *Structure and Architecture* 2ed includes a revised opening chapter and a new section that discusses prominent buildings constructed since the last edition was published in 1994 Angus MacDonald deals with structures holistically relating detailed topics back to the whole structure and building He aims to answer the questions What are architectural structures How does one define the difference between the structure of a building and all of the other components and elements of which it

consists What are the requirements of structures What is involved in their design An understanding of the concepts involved in answering these questions and an appreciation of how the structure of a building functions enhances the ability of an individual to appreciate its architectural quality This book is unique in that it discusses the structural component of architectural design in the context of visual and stylistic issues

Shape and Structure, from Engineering to Nature Adrian Bejan, 2000-10-16 Seemingly universal geometric forms unite the flow systems of engineering and nature For example tree shaped flows can be seen in computers lungs dendritic crystals urban street patterns and communication links In this groundbreaking book first published in 2000 Adrian Bejan considers the design and optimization of engineered systems and discovers a deterministic principle of the generation of geometric form in natural systems Shape and structure spring from the struggle for better performance in both engineering and nature This idea is the basis of the new constructal theory the objective and constraints principle used in engineering is the same mechanism from which the geometry in natural flow systems emerges From heat exchangers to river channels the book draws many parallels between the engineered and the natural world Among the topics covered are mechanical structure thermal structure heat trees ducts and rivers turbulent structure and structure in transportation and economics The numerous illustrations examples and homework problems in every chapter make this an ideal text for engineering design courses Its provocative ideas will also appeal to a broad range of readers in engineering natural sciences economics and business
