Kerner,2017-05-26 This book offers a detailed investigation of breakdowns in traffic and transportation networks It shows empirically that transitions from free flow to so called synchronized flow initiated by local disturbances at network bottlenecks display a nucleation type behavior while small disturbances in free flow decay larger ones grow further and lead to breakdowns at the bottlenecks Further it discusses in detail the significance of this nucleation effect for traffic and transportation theories and the consequences this has for future

automatic driving traffic control dynamic traffic assignment and optimization in traffic and transportation networks Starting from a large volume of field traffic data collected from various sources obtained solely through measurements in real world traffic the author develops his insights with an emphasis less on reviewing existing methodologies models and theories and more on providing a detailed analysis of empirical traffic data and drawing consequences regarding the minimum requirements for any traffic and transportation theories to be valid The book proves the empirical nucleation nature of traffic breakdown in networks discusses the origin of the failure of classical traffic and transportation theories shows that the three phase theory is incommensurable with the classical traffic theories and explains why current state of the art dynamic traffic assignments tend to provoke heavy traffic congestion making it a valuable reference resource for a wide audience of scientists and postgraduate students interested in the fundamental understanding of empirical traffic phenomena and related data driven phenomenology as well as for practitioners working in the fields of traffic and transportation engineering
