Regulation of Insulin Secretion

- Increased parasympathetic stimulation of the pancreas and increased secretion of hormones such as gastrin, secretin, and cholecystokinin associated with digestion stimulate insulin secretion.
- Insulin stimulates the increased uptake of glucose by most tissues (exceptions are the brain and the liver, which do not depend on insulin for glucose uptake).
- Excess glucose is converted to glycogen, which is stored in skeletal muscle and liver.
- Excess glucose is converted to fat (triglycerides) and stored in adipose tissue.

An increase in blood glucose.

Blood glucose increases

Blood glucose decreases A decrease in blood glucose levels results from the increased movement of glucose into cells.

Blood glucose homeostasis is maintained

An increase in blood glucose results from the decreased movement of glucose into most tissues and the release of glucose from the liver.

 A decrease in blood glucose is detected by the pancreatic islet cells and results in decreased insulin secretion.

A decrease in blood glucose.

- Increased sympathetic stimulation of the pancreas and increased epinephrine release from the adrenal medulia associated with low blood glucose levels and with physical activity inhibit insulin secretion.
- Decreased insulin results in decreased uptake of glucose by most tissues, which makes glucose available for use by the brain.
- Glycogen is broken down to glucose by the liver, which releases glucose into the blood.
- Glucose is synthesized from amino acids by the liver, which releases glucose into the blood.
- Fat is broken down in adipose tissue, which releases fatty acids into the blood. The use of fatty acids by tissues spares glucose usage.
- Fatty acids are converted by the liver into ketones, which are used by other tissues as a source of energy.

Nutrient Regulation of Insulin Secretion Peter R. Flatt, 1992 The mechanisms of release of insulin in response to the body s intake of nutrients has long been one of the central problems of research into diabetes This book presents the latest findings on the topic from the leading laboratories in the field Molecular Nutrition and Diabetes Didac Mauricio, 2015-12-08 Molecular Nutrition and Diabetes A Volume in the Molecular Nutrition Series focuses on diabetes as a nutritional problem and its important metabolic consequences Fuel metabolism and dietary supply all influence the outcome of diabetes but understanding the pathogenesis of the diabetic process is a prelude to better nutritional control Part One of the book provides general coverage of nutrition and diabetes in terms of dietary patterns insulin resistance and the glucose insulin axis while Part Two presents the molecular biology of diabetes and focuses on areas such as oxidative stress mitochondrial function insulin resistance high fat diets nutriceuticals and lipid accumulation Final sections explore the genetic machinery behind diabetes and diabetic metabolism including signaling pathways gene expression genome wide association studies and specific gene expression While the main focus of each chapter is the basic and clinical research on diabetes as a nutritional problem all chapters also end with a translational section on the implications for the nutritional control of diabetes Offers updated information and a perspective on important future developments to different professionals involved in the basic and clinical research on all major nutritional aspects of diabetes mellitus Explores how nutritional factors are involved in the pathogenesis of both type1 and type2 diabetes and their complications Investigates the molecular and genetic bases of diabetes and diabetic metabolism through the lens of a rapidly evolving field of molecular nutrition
