

NUTRITIONAL METHODS OF INTESTINAL REGENERATION

By Dr R. Bernard (A.B., M.A., Ph.D.)

PART ONE

The normal chemical composition of the blood is disturbed either by deficiency of required constituents - which it is the purpose of vitamin and mineral therapy to replace — and also by the presence within it of toxins absorbed from the intestinal tract. These tend to work against the beneficial effects of the vitamins and minerals we take. This fact is often overlooked by people who think that merely swallowing a few vitamin capsules each day solves their health problem. As important as it is to replace chemical efficiencies of the blood by intake of vitamin dietary supplements, it is equally important to avoid autointoxication, or the poisoning of the bloodstream by toxins derived from putrefactive decay of food residues in the intestinal tract. As the result of modern researches definite nutritional methods have been developed for accomplishing this. These will be presented in this Study Course.

A bloodstream that is free from toxins and also rich in all of its necessary constituents will maintain in the body in a state of health. By normalizing intestinal functions, so that there will be complete freedom from constipation and autointoxication, the biological conditions are provided so that vitamin and mineral therapy produce optimal results.

Intestinal Regeneration is the first step in health regeneration. Blood regeneration is the next step. A third step is Endocrine Regeneration. Just as intestinal regeneration is the precondition of blood regeneration, so blood regeneration is the precondition of endocrine regeneration. The endocrine glands, in turn, determine our general vitality, our cerebral efficiency and our life span. Since it is known that the general endocrine regeneration that brings on the symptoms of senility is a product of intestinal autointoxication, we can understand why

Gastrointestinal Damage and Metabolic Disorders Daniele Maria-Ferreira,Marcelo Biondaro Gois,Elizabeth S. Fernandes,2025-08-19

Gastrointestinal GI disorders can be described as physiologic and or morphologic changes in the GI system and include motility disorders changes in mucosal and immune function and alterations in the intestinal microbiota Inflammatory bowel diseases such as ulcerative colitis and Crohn s disease are the most serious disorders causing chronic inflammation while other chronic inflammatory diseases that cause severe damage include irritable bowel syndrome and gastroesophageal reflux The main causes of these diseases include genetic predisposition unhealthy lifestyles pharmacological therapies and infections Regardless of the specific disorder it is known to cause considerable discomfort and a reduced quality of life for those affected and there is increasing evidence that damage to the gastrointestinal tract can influence the development of metabolic diseases For example impaired release of gut hormones responsible for signaling the feeling of satiety could be associated with the occurrence of obesity long term alterations in the composition of the gut microbiota may play a role in the development of metabolic diseases among others

The Stem Cell Microenvironment and its Role in Regenerative Medicine and Cancer Pathogenesis Cristian Pablo Pennisi,Mayuri Sinha Prasad,Pranela Rameshwar,2016-12-05

How stem cells behave is very much a factor of their local microenvironment also known as the stem cell niche Physical chemical or electrical signals from the neighboring cells or biochemical signals from distant cells are crucial in the cell fate decision process A major challenge of tissue engineering is to mimic the natural cell environment by designing very sophisticated scaffolds able not only to mechanically support cells but also to release signals biologically relevant for governing stem cell fate In addition increasing evidence suggests that abnormal interaction of stem cells with their niche is responsible for altered cell function leading to malignant transformation This book discusses some of the recent advances in stem cell research that may help understanding the properties of the niche that govern stem cell fate Technical topics discussed include Stem cell biologyCancer stem cellsStem cell interactions with biomaterialsEngineering the stem cell microenvironmentStem cells in tissue regeneration and repair
