ABSTRACT: In this paper, several approaches to computer supported recognition of accelerative and decelerative patterns in the Foetal Heart Rate signal are presented, in order to automate the diagnosis of foetal well being. The classifiers discussed in here evolve from a rule-based approach to a neuro-fuzzy system, through classical neural network architectures. The main problem regarding the symbolic approach was a limitation in knowledge elicitation. In order to solve this question and to find better limits among decision regions, first a classical neural network approach, and second a neural-fuzzy system able to deal with ill-defined data were considered. The latter showed best results with a classification rate of 72.6% for accelerations and 65.7% for decelerations. Finally, it is shown how this approach opens new possibilities of improvement as it can be used as a method for knowledge acquisition.

INTRODUCTION

Pattern recognition is a scientific discipline, the goal of which is the classification of objects into a number of categories. The most classical framework in which to formulate solutions to pattern recognition problems is the statistical one, where the probabilistic nature of the information requiring processing is recognised. However, in recent years neural computation and hybrid architectures for intelligent systems have appeared as practical technologies with successful applications in this field. Although every artificial intelligent technique (i.e., fuzzy logic, neural networks, genetic algorithms and expert systems) has particular computational properties that make it suited for a particular type of problems, there are great advantages in their synergistic utilisation.

A specific case in which the solution to the problem arises from the combination of different intelligent techniques is the recognition of patterns in the Foetal Heart Rate (FHR) signal. This signal is employed in Non-Stress Tests (NST) for the evaluation of the foetal state [Parer (1997)]. In order to establish a diagnosis two principal kind of patterns -among some others- have to be detected in the FHR signal:

- *Accelerations*, defined as transitory increments in the FHR of at least 10-15 bpm (beats per minute) with duration from 15 seconds to 2 minutes, and
- *Decelerations*, defined as transitory reductions in the FHR of at least 15 bpm in amplitude and with the same duration requirements.

CAFE (Computer Aided Foetal Evaluator) [Guijarro (1998b)][Guijarro (2000)] is a hybrid system developed for foetal monitorisation by means of the NST. This system automates all the tasks involved in this process, from the acquisition of the needed signals and data, to the establishment of a diagnosis about foetal state, and the suggestion of a therapy when required. At present CAFE contains two modules that jointly operate in order to make the extraction of foetal patterns from the FHR signal. The first one, called the detection module, takes charge of localising the position of a candidate pattern. For its development two different approaches have been taken. The first one is based on an algorithmic-symbolic system, that makes use of knowledge extracted from experts. The second one is based on a Multi-Resolution Principal Component Analysis neural network [Alonso (1999)].

The second module, called the classification module, determines from a set of features, if this candidate pattern accomplishes the adequate requirements in order to be definitely classified as a pattern of interest from the NST and the

International Conference on Advances in Pattern Recognition Sameer Singh, 2012-12-06 International Conference on Advances in Pattern Recognition ICAPR 98 at Plymouth represents an important meeting for advanced research in pattern recognition. There is considerable interest in the areas of image processing, medical imaging, speech recognition, document analysis and character recognition, fuzzy data analysis and neural networks. ICAPR 98 is aimed at providing an international platform for invited research in this multi-disciplinary area. It is expected that the conference will grow in future years to include more research contributions that detail state of the art research in pattern recognition. ICAPR 98 attracted contributions from different countries of the highest quality. I should like to thank the programme and organising committee for doing an excellent job in organising this conference. The peer-reviewed nature of the conference ensured high quality publications in these proceedings. My personal thanks to Mrs Barbara Davies who served as conference secretary and worked tirelessly in organising the conference. I thank the organising chair for the local arrangements and our should also key note plenary and tutorial speakers for their valuable contributions to the conference. I also thank Springer Verlag for publishing these proceedings that will be a valuable source of research reference for the readers. This six volume set presents cutting edge advances and applications of expert systems. Because expert systems combine the expertise of engineers, computer scientists and computer programmers, each group will benefit from buying this important reference work. An expert system is a knowledge based computer system that emulates the decision making ability of a human expert. The primary role of the expert system is to perform appropriate functions under the close supervision of the human whose work is supported by that expert system. In the reverse, this same expert system can monitor and double check the human in the performance of a task. Human computer interaction in our highly complex world requires the development of a wide array of expert systems. Expert systems techniques and applications are presented for a diverse array of topics including Experimental design and decision support. The integration of machine learning with knowledge acquisition for the design of expert systems. Process planning in design and manufacturing systems and process control applications. Knowledge discovery in large scale knowledge bases. Robotic systems. Geographic information systems. Image analysis, recognition and interpretation. Cellular automata methods for pattern recognition. Real time fault tolerant control systems. CAD based vision systems in pattern matching processes. Financial systems. Agricultural applications. Medical diagnosis. **Towards**
