Interpretations of American History Francis G. Couvares, Gerald N. Grob, Martha Saxton, George Athan Billias (historien)), 2000 **Interpretations of American History, Volume I: Through Reconstruction** Francis G. Couvares, Martha Saxton, Gerald N. Grob, George Athan Billias, 2008-09-05 Now in a new edition from Bedford St Martin s Interpretations of American History offers an essential collection of essays and readings on American historiography Each chapter opens with an extended essay that explores the historiography specific to that chapter s topic followed by two readings by preeminent historians that highlight different although not always diametrically opposed historical approaches Fully updated for the next generation of scholars the most respected historiographical reader now comes with all the care and quality that you expect from Bedford St Martin s Guide to Three Dimensional Structure and Motion Factorization Guanghui Wang, Jonathan Wu, 2010-10-20 The problem of structure and motion recovery from image sequences is an important theme in computer vision Considerable progress has been made in this field during the past two decades resulting in successful applications in robot navigation augmented reality industrial inspection medical image analysis and digital entertainment among other areas However many of these methods work only for rigid objects and static scenes The study of non rigid structure from motion is not only of academic significance but also has important practical applications in real world nonrigid or dynamic scenarios such as human facial expressions and moving vehicles This practical guide reference provides a comprehensive overview of Euclidean structure and motion recovery with a specific focus on factorization based algorithms The book discusses the latest research in this field including the extension of the factorization algorithm to recover the structure of non rigid objects and presents some new algorithms developed by the authors Readers require no significant knowledge of computer vision although some background on projective geometry and matrix computation would be beneficial Topics and features presents the first systematic study of structure and motion recovery of both rigid and non rigid objects from images sequences discusses in depth the theory techniques and applications of rigid and non rigid factorization methods in three dimensional computer vision examines numerous factorization algorithms covering affine perspective and quasi perspective projection models provides appendices describing the mathematical principles behind projective geometry matrix decomposition least squares and nonlinear estimation techniques includes chapter ending review questions and a glossary of terms used in the book This unique text offers practical guidance in real applications and implementations of 3D modeling systems for practitioners in computer vision and pattern recognition as well as serving as an invaluable source of new algorithms and methodologies for structure and motion recovery for graduate students and researchers *Interpretations of American History: From Reconstruction* , 2009 **Linear Algebra for Pattern Processing** Kenichi Kanatani, 2022-06-01 Linear algebra is one of the most basic foundations of a wide range of scientific domains and most textbooks of linear algebra are written by mathematicians However this book is specifically intended to

students and researchers of pattern information processing analyzing signals such as images and exploring computer vision and computer graphics applications The author himself is a researcher of this domain Such pattern information processing deals with a large amount of data which are represented by high dimensional vectors and matrices There the role of linear algebra is not merely numerical computation of large scale vectors and matrices In fact data processing is usually accompanied with geometric interpretation For example we can think of one data set being orthogonal to another and define a distance between them or invoke geometric relationships such as projecting some data onto some space Such geometric concepts not only help us mentally visualize abstract high dimensional spaces in intuitive terms but also lead us to find what kind of processing is appropriate for what kind of goals First we take up the concept of projection of linear spaces and describe spectral decomposition singular value decomposition and pseudoinverse in terms of projection As their applications we discuss least squares solutions of simultaneous linear equations and covariance matrices of probability distributions of vector random variables that are not necessarily positive definite We also discuss fitting subspaces to point data and factorizing matrices in high dimensions in relation to motion image analysis Finally we introduce a computer vision application of reconstructing the 3D location of a point from three camera views to illustrate the role of linear algebra in dealing with data with noise This book is expected to help students and researchers of pattern information processing deepen the geometric understanding of linear algebra
