Photogeology and Regional Mapping J. A. E. Allum, 2013-10-22 Photogeology and Regional Mapping covers the geological interpretation of aerial photographs the compilation of the interpretations on to maps the use of aerial photographs in the field and the use of aerial photography for the production of the final geological map This book is organized into 10 chapters and starts with an introduction to the aerial photograph The subsequent chapters deal with the properties of the aerial photograph including the scale parallax and their difference These chapters also survey the process of stereoscopy the stereoscopic vision pseudoscopic vision and setting up the aerial photographs These topics are followed by discussions on interpretation of the aerial photographs encoded into a map Other chapters describe the production of the photogeological map and field mapping with the use of aerial photographs The last chapters consider the compilation of the encoded aerial photographs made into maps and the photogrammetry for geologists that explains the minor control plot detail plotting measurement of height differences using a stereometer This book will be of value to geologists

Characterization in Karst and Pseudokarst Terraines Richard C. Benson, Lynn B. Yuhr, 2015-09-24 This book provides a practical strategy for obtaining a more complete and accurate geologic site characterization The strategy and methods to characterize complex geologic settings are readily available The strategy utilizes readily available technology basic science and good old fashioned common sense resulting in a solid understanding of geologic and even karst or pseudokarst conditions We provide an introduction to many off the shelf methods available for site characterization as well as examples of their application throughout the book The purpose of a geologic site characterization is to understand the 3 dimensional geologic framework along with the engineering and hydrologic properties of a site including any man made impacts A well done site characterization is the cornerstone of all geotechnical groundwater and environmental projects The geologic conditions particularly karst conditions can significantly impact a site including its structural stability groundwater pathways and potential for rapid transport or traps for contaminants Once we have adequately characterized the geologic conditions can we carry our remediation design and construction model flow and make risk assessments that are accurate and reliable
