Selected Papers Of Norman Levinson:

Selected Papers of Norman Levinson J.A. Nohel, D.H. Sattinger, Gian-Carlo Rota, 1997-12-18 The deep and original ideas of Norman Levinson have had a lasting impact on fields as diverse as differential integral equations harmonic complex stochastic analysis and analytic number theory during more than half a century Yet the extent of his contributions has not always been fully recognized in the mathematics community For example the horseshoe mapping constructed by Stephen Smale in 1960 played a central role in the development of the modern theory of dynamical systems and chaos The horseshoe map was directly stimulated by Levinson's research on forced periodic oscillations of the Van der Pol oscillator and specifically by his seminal work initiated by Cartwright and Littlewood In other topics Levinson provided the foundation for a rigorous theory of singularly perturbed differential equations He also made fundamental contributions to inverse scattering theory by showing the connection between scattering data and spectral data thus relating the famous Gel'fand Levitan method to the inverse scattering problem for the Schrodinger equation He was the first to analyze and make explicit use of wave functions now widely known as the Jost functions Near the end of his life Levinson returned to research in analytic number theory and made profound progress on the resolution of the Riemann Hypothesis Levinson's papers are typically tightly crafted and masterpieces of brevity and clarity It is our hope that the publication of these selected papers will bring his mathematical ideas to the attention of the larger mathematical community [Selected of Norman Levinson](#) Norman Levinson, 1998 Norman Levinson 1912-1975 was a mathematician of international repute This collection of his selected papers bears witness to the profound influence Levinson had on research in mathematical analysis with applications to problems in science and technology **Selected Papers of Norman Levinson** Norman Levinson, 1998 [Selected Papers of Norman Levinson](#) John Nohel, David Sattinger, G.-C. Norbert Wiener 1894-1964 Pesi R. Masani, 2012-12-06 Norbert Wiener

was an American mathematician and philosopher He was a professor of mathematics at the Massachusetts Institute of Technology MIT A child prodigy Wiener later became an early researcher in stochastic and mathematical noise processes contributing work relevant to electronic engineering electronic communication and control systems Wiener is considered the originator of cybernetics a formalization of the notion of feedback with implications for engineering systems control computer science biology neuroscience philosophy and the organization of society Wiener thought on a grand scale and stressed the adaptation of technical concepts from pure mathematics and electrical engineering outside their technical contexts Masani's interesting and thoughtful book analyses both Wiener's mathematical and his nonmathematical ideas in sympathetic and sensitive detail Readers will find much to appreciate in this book in addition to the discussion of Wiener's technical research

Proceedings of the Norbert Wiener Centenary Congress, 1994 Vidyadhar Mandrekar, Pesi Rustom Masani, 1997 A mathematician on par with the greatest in the century Norbert Wiener was a universal thinker of colossal proportions This book contains the proceedings of the Norbert Wiener Centenary Congress held at Michigan State University on November 27 December 2 1994 The aim of the Congress was to reveal the depth and strong coherence of thought that runs through Wiener's legacy and to exhibit its continuation in on going research This volume brings together the great minds who have furthered Wiener's ideas in physics stochastics harmonic analysis philosophy prosthesis and cybernetics The presentations coherently lay out the developments of the subjects from their inception This volume provides an excellent pathway for new investigators who may wish to pursue these developments by following the footsteps of world experts There is no other book available in which experts in the various fields in which Wiener worked have presented his thoughts and contributions in such a coherent and lucid manner

Selected Papers of C.C. Lin Chia-Ch'iao Lin, 1987-01-01 One of the most prolific applied mathematicians of the mid twentieth century Prof Lin is a highly respected professor at MIT These volumes a collection of Prof Lin's papers from 1943 to 1986 is an attempt to exhibit a historical

perception of the development of ideas in the following areas of research Stability of Parallel Flows Turbulence Spiral
 Structure of Galaxies Prof Lin has written short comments and personal recollections on the development of thinking in these
 subjects In addition to research papers there are two essays dealing with the basic thinking that underlies the development
 of applied mathematics as an academic discipline in USA Other topics of interest are Aerodynamics Liquid Helium Solid State
 Physics Plasticity and Magnetohydrodynamics About 51 papers are included in these two volumes Selected Papers on
Algebra and Topology by Garrett Birkhoff J.S. Oliveira, G.-C. Rota, 1987-01-01 The present volume of reprints are what I
 consider to be my most interesting and influential papers on algebra and topology To tie them together and to place them in
 context I have supplemented them by a series of brief essays sketching their historical background as I see it In addition to
 these I have listed some subsequent papers by others which have further developed some of my key ideas The papers on
 universal algebra lattice theory and general topology collected in the present volume concern ideas which have become
 familiar to all working mathematicians It may be helpful to make them readily accessible in one volume I have tried in the
 introduction to each part to state the most significant features of each paper reprinted there and to indicate later
 developments The background that shaped and stimulated my early work on universal algebra lattice theory and topology
 may be of some interest As a Harvard undergraduate in 1928-32 I was encouraged to do independent reading and to write an
 original thesis My tutorial reading included de la Vallée Poussin's beautiful Cours d'Analyse Infinitesimale Hausdorff's
 Grundzüge der Mengenlehre and Frechet's Espaces Abstraits In addition I discovered Carathéodory's 1912 paper Über das
 lineare Mass von Punktmengen and Hausdorff's 1919 paper on Dimension und Ausseres Mass and derived much inspiration
 from them A fragment of my thesis analyzing axiom systems for separable metrizable spaces was later published 2 This
 background led to the work summarized in Part IV *Recollections* Joel Segel, 2009-01-03 This book traces the history of the
 MIT Department of Mathematics one of the most important mathematics departments in the world through candid in depth
 lively conversations with a select and diverse group of its senior members The process reveals much about the motivation
 path and impact of research mathematicians in a society that owes so much *Research and Discovery* Russell Lawson, 2008
 This encyclopedia is an overview of the history of science in America from colonial times to the present Organized
 alphabetically within scientific discipline the set is divided into fourteen sections that include overview essays tracing the
 historical development of the specific discipline in a cultural and social context A to Z entries on people institutions events
 developments and significant concepts and documents highlighting the development of the discipline An extensive topic
 finder bibliographic citations and a general index round out this work Publisher *Harmonies of Disorder* Leone
 Montagnini, 2017-08-19 This book presents the entire body of thought of Norbert Wiener 1894-1964 knowledge of which is
 essential if one wishes to understand and correctly interpret the age in which we live The focus is in particular on the
 philosophical and sociological aspects of Wiener's thought but these aspects are carefully framed within the context of his

scientific journey Important biographical events including some that were previously unknown are also highlighted but while the book has a biographical structure it is not only a biography The book is divided into four chronological sections the first two of which explore Wiener's development as a philosopher and logician and his brilliant interwar career as a mathematician supported by his philosophical background The third section considers his research during World War II which drew upon his previous scientific work and reflections and led to the birth of cybernetics Finally the radical post war shift in Wiener's intellectual path is considered examining how he came to abandon computer science projects and commenced ceaseless public reflections on the new sciences and technologies of information their social effects and the need for responsibility in science

Tauberian Theory Jacob Korevaar, 2013-03-09 Tauberian theory compares summability methods for series and integrals helps to decide when there is convergence and provides asymptotic and remainder estimates The author shows the development of the theory from the beginning and his expert commentary evokes the excitement surrounding the early results He shows the fascination of the difficult Hardy Littlewood theorems and of an unexpected simple proof and extolls Wiener's breakthrough based on Fourier theory There are the spectacular high indices theorems and Karamata's regular variation which permeates probability theory The author presents Gelfand's elegant algebraic treatment of Wiener theory and his own distributional approach There is also a new unified theory for Borel and circle methods The text describes many Tauberian ways to the prime number theorem A large bibliography and a substantial index round out the book
