Prognostic Variables In Node Negative And Node Positive Breast Cancer:

Prognostic variables in node-negative and node-positive breast cancer Giampietro Gasparini,1999-02-28 During the last decade important advancements on the understanding of the molecular mechanisms involved in tumorigenesis and progression of breast cancer have been made particularly regarding the mechanisms of control of the cell cycle apoptosis metastasis and angiogenesis Translation of basic research to the clinical setting by the identification of assessable markers associated with the above biological mechanisms has permitted verification of the clinical significance of several prognostic indicators and has highlighted the heterogeneous nature of invasive breast cancer Reprinted from Breast Cancer Research And Treatment this text contains original papers overviews and position papers on the methodological aspects and the clinical significance of the more interesting prognostic and predictive indicators Ultimately the determination of biological prognostic and predictive markers with easily applicable reproducible and standardizable assays is an integral part of future research aimed to improve the management of patients operated for breast cancer in the years to come Novel therapeutic strategies based not only on chemotherapy or hormone therapy but directed at interfering with the molecular targets involved in tumor progression and metastasis warrant clinical testing and are a major challenge to enhance the potential cure of breast cancer

Adjuvant Therapy of Breast Cancer I. Craig Henderson, 2012-12-06 The results of randomized trials evaluating the use of early or adjuvant systemic treatment for patients with resectable breast cancer provide an eloquent rebuttal to those who would argue that we have made no progress in the treatment of cancer Many of the tumors that we have been most successful in curing with chemotherapy and other newer forms of treatment are relatively uncommon In contrast breast cancer continues to be the single most common malignancy among women in the western world is increasingly a cause of death throughout Asia and Third World countries and remains one of the most substantial causes of cancer mortality world wide The use of mammography as a means of early detection has been shown to reduce breast cancer mortality by 25-35% among those populations in which it is utilized The use of adjuvant systemic treatment in appropriate patients provides a similar and additional reduction in breast cancer mortality Few subjects have been so systematically studied in the history of medicine and it seems fair to conclude that the value to adjuvant systemic therapy in prolonging the lives of women with breast cancer is more firmly supported by empirical evidence than even the more conventional or primary treatments using various combinations of surgery and radiotherapy
