Programming Languages And System Architectures Lecture Notes In Computer Science Volume 78:

Programming Languages and Systems - Esop'96 Hanne R. Nielson, 1996-04-03 This book presents the refereed proceedings of the Sixth European Symposium on Programming ESOP 96 held in Linköping Sweden in April 1996 The 23 revised full papers included were selected from a total of 63 submissions also included are invited papers by Cliff B Jones and by Simon L Peyton Jones The book is devoted to fundamental issues in the specification analysis and implementation of programming languages and systems the emphasis is on research issues bridging the gap between theory and practice Among the topics addressed are software specification and verification programming paradigms program semantics advanced type systems program analysis program transformation and implementation techniques Functional Programming and Input/Output Andrew D. Gordon, 1994-10-13 Extends functional programming to solve I/O problems while retaining usual verification features **Functional Programming Languages and Computer Architecture** Jean-Pierre Jouannaud, 1985-09 The Organization of Reduction, Data Flow, and Control Flow Systems Werner Kluge, 1992 In light of research over the last decade on new ways of representing and performing computations this book provides a timely reexamination of computer organization and computer architecture It systematically investigates the basic organizational concepts of reduction data flow and control flow or state transition and their relationship to the underlying programming paradigms For each of these concepts Kluge looks at how principles of language organization translate into architectures and how architectural features translate into concrete system implementations comparing them in order to identify their similarities and differences The focus is primarily on a functional programming paradigm based on a full fledged operational calculus and on its realization by various reduction systems Kluge first presents a brief outline of the overall configuration of a computing system and of an operating system kernel introduce elements of the theory of Petri nets as modeling tools for nonsequential systems and processes and use a simple form of higher order Petri nets to identify by means of examples the operational and control disciplines that govern the organization of reduction data flow and control flow computations He then introduces the notions of abstract algorithms and of reductions and includes an overview of the theory of the calculus The next five chapters describe the various computing engines that realize the reduction semantics of a full fledged calculus The remaining chapters provide self contained investigations of the G machine SKI combinator reduction and the data flow approach for implementing the functional programming paradigm This is followed by a detailed description of a typical control flow or von Neumann machine architecture a VAX11 system Properties of these machines are summarized in the concluding chapter which classifies them according to the semantic models they support Programming Languages: Implementations, Logics, and Programs S. Doaitse Swierstra, 1996-09-11 This book constitutes the refereed proceedings of the Eighth International Symposium on Programming Languages Implementations Logics and Programs PLILP 96 held in conjunction with ALP and SAS in Aachen Germany in September 1996 The 30 revised full papers presented in the volume

were selected from a total of 97 submissions also included are one invited contribution by Lambert Meerlens and five posters and demonstrations The papers are organized in topical sections on typing and structuring systems program analysis program transformation implementation issues concurrent and parallel programming tools and programming environments lambda calculus and rewriting constraints and deductive database languages , **Scientific and Technical Aerospace Reports** ,1980

RIMS Symposium on Software Science and Engineering II Eiichi Goto,Keijiro Araki,Taiichi Yuasa,1986
Database Programming Languages Sophie Cluet,Rick Hull,1998-07-29 This book constitutes the thoroughly refereed post workshop proceedings of the 6th International Workshop on Database Programming Languages DBPL 6 held in Estes Park Colorado USA in August 1997 The 20 revised full papers presented have gone through two rounds of reviewing and selection Also included are two invited talks the transcription of a panel discussion and an introductory survey by the volume editors The papers address all current aspects of database programming languages in particular spatial databases typing query languages for new applications views expressive power aggregate queries cooperative work and transactions **Formal Models and Semantics** Bozzano G Luisa,2014-06-28 The second part of this Handbook presents a choice of material on the theory of automata and rewriting systems the foundations of modern programming languages logics for program specification and verification and some chapters on the theoretic modelling of advanced information processing *Advances in Database Technology - EDBT '90* Francois Bancilhon,Costantino Thanos,1990-02-21 Database technology is currently being pushed by the needs of new applications and pulled by the opportunities of novel developments in hardware and systems architecture The invited paper two panel sessions and 27 papers in this volume report on how the technology is currently extending One broad area covered is extended database semantics including data models and data types databases and logic complex objects and expert system approaches to databases The other area covered is raw architectures and increased database systems support including novel transaction models data distribution and replication database administration and access efficiency *Object-Based Parallel and Distributed Computation* Jean-Pierre Briot,1996-07-24 This book contains a refereed collection of revised papers selected from the presentations at the France Japan Workshop on Object Based Parallel and Distributed Computation OBPDC 95 held in Tokyo in June 1995 The 18 full papers included in the book constitute a representative well balanced set of timely research contributions to the growing field of object based concurrent computing The volume is organized in sections on massively parallel programming languages distributed programming languages formalisms distributed operating systems dependable distributed computing and software management **Mechanisms for Reliable Distributed Real-Time Operating Systems** J. Duane Northcutt,2014-05-10 Mechanisms for Reliable Distributed Real Time Operating Systems The Alpha Kernel deals with the Alpha kernel a set of mechanisms that support the construction of reliable modular decentralized operating systems for real time control applications An initial snapshot of the kernel design and implementation is provided Comprised of seven chapters this volume

begins with a background on the Alpha operating system kernel and its implementation followed by a description of the programming abstractions created for the Alpha kernel The third chapter defines the client interface provided by the kernel in support of the given programming abstractions while the fourth chapter focuses on the functional design of the kernel The hardware on which the kernel was constructed as well as the implications of this hardware on the design and implementation of the kernel is also examined The final chapter compares Alpha with other relevant operating systems such as Hydra Cronus Eden Argus Accent and Locus This book will appeal to computer scientists systems designers and undergraduate and graduate students of computer science Distributed Algorithms, second edition Wan Fokkink, 2018-03-02 The new edition of a guide to distributed algorithms that emphasizes examples and exercises rather than the intricacies of mathematical models This book offers students and researchers a guide to distributed algorithms that emphasizes examples and exercises rather than the intricacies of mathematical models It avoids mathematical argumentation often a stumbling block for students teaching algorithmic thought rather than proofs and logic This approach allows the student to learn a large number of algorithms within a relatively short span of time Algorithms are explained through brief informal descriptions illuminating examples and practical exercises The examples and exercises allow readers to understand algorithms intuitively and from different perspectives Proof sketches arguing the correctness of an algorithm or explaining the idea behind fundamental results are also included The algorithms presented in the book are for the most part classics selected because they shed light on the algorithmic design of distributed systems or on key issues in distributed computing and concurrent programming This second edition has been substantially revised A new chapter on distributed transaction offers up to date treatment of database transactions and the important evolving area of transactional memory A new chapter on security discusses two exciting new topics blockchains and quantum cryptography Sections have been added that cover such subjects as rollback recovery fault tolerant termination detection and consensus for shared memory An appendix offers pseudocode descriptions of many algorithms Solutions and slides are available for instructors Distributed Algorithms can be used in courses for upper level undergraduates or graduate students in computer science or as a reference for researchers in the field Artificial Intelligence IV P. Jorrand, V. Sgurev, 2016-01-22 Presenting recent results and ongoing research in Artificial Intelligence this book has a strong emphasis on fundamental questions in several key areas programming languages automated reasoning natural language processing and computer vision AI is at the source of major programming language design efforts Different approaches are described with some of their most significant results languages combining logic and functional styles logic and parallel functional and parallel logic with constraints A central problem in AI is automated reasoning and formal logic is historically at the root of research in this domain This book presents results in automatic deduction non monotonic reasoning non standard logic machine learning and common sense reasoning Proposals for knowledge representation and knowledge engineering are described and the neural net challenger to classical symbolic AI is also defended Finally AI systems must be

able to interact with their environment in a natural and autonomous way Natural language processing is an important part of this Various results are presented in discourse planning natural language parsing understanding and generation The autonomy of a machine for perception of its physical environment is also an AI problem and some research in image processing and computer vision is described

Models and Analysis for Distributed Systems Serge Haddad,Fabrice Kordon,Laurent Pautet,Laure Petrucci,2013-02-07 Nowadays distributed systems are increasingly present for public software applications as well as critical systems software applications as well as critical systems This title and Distributed Systems Design and Algorithms from the same editors introduce the underlying concepts the associated design techniques and the related security issues The objective of this book is to describe the state of the art of the formal methods for the analysis of distributed systems Numerous issues remain open and are the topics of major research projects One current research trend consists of profoundly mixing the design modeling verification and implementation stages This prototyping based approach is centered around the concept of model refinement This book is more specifically intended for readers that wish to gain an overview of the application of formal methods in the design of distributed systems Master s and PhD students as well as engineers in industry will find a global understanding of the techniques as well as references to the most up to date works in this area
