Natural draught cooling towers, Natural Draught Cooling Towers P. L. Gould, W. B. Krätzig, I. Mungan, U. Wittek, 1984-09-01 Natural draught cooling towers are inevitable for the economic generation of electricity under environmental aspects In any thermal power plant heated steam drives a turbogenerator which produces the electric energy In order to create an effective heat sink behind the turbine the steam is condensed and recycled into the boiler This requires a large amount of cooling water which is heated by running through the condenser Even in the most efficient fossil fuel thermal nuclear power plants only about 40-30 % of the generated heat is turned in to electric energy The rest of heat of 60-70 % is discharged into the environment through the smokestack and the cooling water circuit To avoid thermal pollution of natural water resources the heated cooling water should be recooled artificially in a cooling system and reused Among all technical solutions natural draught cooling towers are effective economic and widely spread corrective measures In large power plants only natural draught cooling towers are able to recover the immense quantities of water required for cooling Thus only these engineering structures are able to balance environmental factors economic investment and operating costs of the power station with the demands of a reliable electric energy supply
