Progress In Sensory Physiology:

Progress in Sensory Physiology ,2012-12-06 I fancy that many of you like myself have woken up in the night with a sleeping arm or leg It is a very peculiar feeling to have that arm or leg cold and lifeless hanging there at your side as if it were something which does not belong to you In such situations you recover some of the motor functions before the sensory functions which enable you to move the limb like a pendulum For a few seconds the arm functions as an artificial limb a prosthesis without sensors In general we are not aware of the importance of our sensory organs until we lose them You do not feel the pressure of your clothes on the skin or the ring on your finger In the nineteenth century such phenomena generally named adaptation were studied to a great extent particularly in vision as well as in the so called lower senses The question whether sensory adaptation was due to changes in the peripheral sensory receptors or in the central nervous structure remained in general open until the 1920s Then the development of the electronic arsenal gave us the means to attack the problem by direct observations of the electrical events in the peripheral as well as the central nervous system But even today there are still some blank areas in our knowledge of adaptation Progress in sensory physiology 10 a85,1985

Progress in Sensory Physiology ,2012-12-06 **Progress in Sensory Physiology** ,2012-12-06 **Progress in Sensory Physiology** R. C. Hardie,Hansjochem Autrum,1985-01-01 Progress in Sensory Physiology ,2012-12-06 The study of the functional organization of the first synapse of the centripetal visual pathway at the outer plexiform layer level OPL ought to be made through the application of combined histological electrophysiological and neurochemical techniques A large amount of new evidence has been accumulated in the past 20 years on the structure of the retina and on the electrical responses of retinal cells to light stimulus Also recently many substances considered as neurotransmitters in the brain have been found in the retina The goal of the study of retinal function is to integrate the data obtained by structural and electrophysiological techniques and to identify and determine the role played by neurotransmitters or neuromodulators in the function of the retina In this study it is important to realize the morphological and biochemical diversity displayed by the visual cells in the vertebrate retina which according to Crescetti 1972 has been produced through the interaction of natural selection with diversity in the photic environment The evidence obtained shows that bipolar and especially horizontal cells closely related to visual cells display morphological and probably biochemical differences among classes genus and even species according to the photic environment These differences give peculiarities to the organization of the OPL which must be taken into account when studying a particular retina with electrophysiological or neurochemical techniques Progress in Sensory Physiology ,1981 Progress in Sensory Physiology Hansjochem Autrum,1985 **Progress in Sensory Physiology** ,1987-04-23 **Progress in Sensory Physiology** ,2012-12-06 **Control of Nociceptive Transmission in the Spinal Cord** William D. Willis,1982-01-01 **Progress in Sensory Physiology 9** ,2012-12-06 Sympathetic afferent fibers originate from a visceral organ course in the thoracolumbar rami communicantes have cell bodies located in dorsal

root ganglia and terminate in the gray matter of the spinal cord Sympathetic afferent fibers from the heart transmit information about noxious stimuli associated with myocardial ischemia i e angina pectoris Previous reviews have described the characteristics of cardiovascular sympathetic afferent fibers Bishop et al 1983 Malliani 1982 This review summarizes that work and focuses on the neural mechanisms underlying the complexities of angina pectoris In order to understand anginal pain cells forming the classical pain pathway the spinothalamic tract STn were chosen for study These cells were chosen to address questions about anginal pain because they transmit nociceptive informa of pain Antidromic tion to brain regions that are involved in the perception activation of STT cells provided a means of identifying cells involved with trans mission of nociceptive information in anesthetized animals Other ascending pathways may also transmit nociceptive information but many studies show that the STT plays an important role Visceral pain is commonly referred to overlying somatic structures The pain of angina pectoris can be sensed over a wide area of the thorax in the retrosternal precordial anterior thoracic and anterior cervical regions of the chest in the left or sometimes even the right shoulder arm wrist or hand or in the jaw and teeth Harrison and Reeves 1968 **Progress in Sensory Physiology** H. Advances in Comparative and Environmental Physiology Fumio Ito,2012-12-06 In the past 5 years there has been an enormous increase of evidence that the ion channels activated by mechanical force are common to a wide variety of cell types Mechanosensitive MS ion channels form a small proportion of the total channel population They are now found in more than

30 cell types from E coli yeast to plant invertebrate and vertebrate cells where they occur in virtually all types of cells from bone to smooth muscle as well as neurons The majority of MS channels are permeable to monovalent cations and are slightly selective for K over Na However there are several reports of anion selective MS channels MS Ca channels and MS channels with large conductances that do not discriminate markedly between cations and anions Recently B Hille has postulated possible evolutionary relationships between several types of ion channels with mechanosensitive channels predating even the eukaryotes Two voltage gated channel types originate with the stem eukaryotes as deduced from the presence of voltage gated K² and Ca channels in protozoa algae or higher plants Agonist gated channels as well as voltage gated Na channels appear with the earliest metazoan animals as deduced from the presence of Na spikes and fast chemical synapses in cnidaria coelenterates ctenophores and all higher animals

Progress in Psychobiology and Physiological Psychology James M. Sprague, Alan N. Epstein, 2013-10-22 Progress in Psychobiology and Physiological Psychology Volume 11 is a collection of studies that discuss certain topics in behavioral neuroscience from different experts in the field The book is divided into four chapters Chapter 1 discusses palatability of food as a response measure Chapter 2 tackles the trigeminal system trigeminal orosensation and ingestive reflexes and the relationship of trigeminal denervation and operant behavior Chapter 3 talks about the role of the stomach in the process of satiety and Chapter 4 covers functional organization of X W and Y cell pathways

The Visual Thalamocortical System and Its Modulation by the Brain Stem Core Mircea Steriade, D. Pare, B. Hu, M. Deschenes, 1990-01-30 This monographic work authored by eminent neurophysiologists will be of major interest to researchers investigating the visual system or working in behavioral neuroscience and sleep research The book deals with the neuronal circuits of the visual thalamocortical system the brainstem and basal forebrain modulatory systems and their neurotransmitters acting upon these circuits and the neuronal activities in the visual thalamocortical system as changed during shifts in behavioral states of vigilance from wake to sleep Data discussed consist of recent studies on light and electron microscopy extra and intracellular recordings of thalamic and cortical neurons neurotransmitter actions and state dependent cellular activities in the visual system
