Abstract: The continuous growth of the world population has led to the constant increase of environmental pollution, with serious consequences for human health. Toxic, non-biodegradable, and recalcitrant organic pollutants (e.g., dyes, pharmaceuticals, pesticides) are discharged into water resources from various industries, such as textiles, leather, pharmaceuticals, plastics, etc. Consequently, the treatment of industrial wastewater, via a sustainable technology, represents a great challenge for worldwide research. Photocatalytic technology, an innovative technique based on advanced oxidation process (AOP), is considered a green technology with promising prospects in the remediation of global environmental issues. In photocatalysis, a very important role is attributed to the photocatalyst, usually a semiconductor material with high solar light absorption capacity and conductivity for photogenerated-charge carriers. Zinc sulfide (ZnS), as n-type semiconductor with different morphologies and band gap energies ($E_g = 3.2\text{--}3.71\text{ eV}$), is recognized as a promising photocatalyst for the removal of organic pollutants from wastewater, especially under UV light irradiation. This review deals with the recent developments (the last five years) in ZnS nanostructures (0D, 1D, 3D) and ZnS-based heterojunctions (n-n, n-p, Z-scheme) used as photocatalysts for organic pollutants' degradation under simulated (UV, Vis) and sunlight irradiation in wastewater treatment. The effects of different synthesis parameters (precursors' type and concentration, capping agents' dosages, reaction time and temperature, metal doping, ZnS concentration in heterostructures, etc.) and properties (particle size, morphology, band gap energy, and surface properties) on the photocatalytic performance of ZnS-based photocatalysts for various organic pollutants' degradation are extensively discussed.

Keywords: ZnS nanostructures; heterojunctions; photocatalysis; organic pollutants; wastewater treatment

1. Introduction

Wastewater loaded with toxic, non-biodegradable organic pollutants represents a real problem, both for aquatic environments and for human life and development. Industrial wastewater originates mainly from the textile industry, but also from the plastics, paper, food, and cosmetic industries, due to the large amount of water used in the various technological stages, especially during the dyeing process [1]. It has been estimated that the wastewater from textile production contributes approximately 20% of the total industrial polluted water [2].

The presence of a very small concentration of organic dyes in water (less than 1 ppm for some dyes) may have serious consequences for the environment, but more for the population health, such as skin and eyes irritations, respiratory and gastric tracts affections, quadriplegia, tachycardia, tissue necrosis, and cancer [3–4].

The dyes most used industrially are azo dyes (usually with an aromatic structure) which, under natural conditions, require a long time to degrade due to their high photosta-

Foundations of Nanotechnology, Volume Two Sabu Thomas, Saeedeh Rafiei, Shima Maghsoodlou, Arezo Afzali, 2014-10-24 The collection of topics in this book reflects the diversity of recent advances in nanoelements formation and interactions in nanosystems with a broad perspective that is useful for scientists as well as for graduate students and engineers One of the main tasks in making nanocomposites is building the dependence of the structure and shape of the nanoelements forming the basis for the composite of their sizes This is because with an increase or a decrease in the specific size of nanoelements their physical mechanical properties such as the coefficient of elasticity strength and deformation parameter vary by over one order The calculations show that this is primarily due to a significant rearrangement of the atomic structure and the shape of the nanoelement The investigation of the above parameters of the nanoelements is technically complicated and laborious because of their small sizes When the characteristics of powder nanocomposites are calculated it is also very important to take into account the interaction of the nanoelements since the changes in their original shapes and sizes in the interaction process and during the formation of the nanocomposite can lead

to a significant change in its properties and a cardinal structural rearrangement. In addition, the studies show the appearance of the processes of the ordering and self assembling leading to a more organized form of a nanosystem. The above phenomena play an important role in nanotechnological processes. They allow nanotechnologies to be developed for the formation of nanostructures by the self assembling method which is based on self organizing processes and building up complex spatial nanostructures consisting of different nanoelements. The study of the above dependences based on the mathematical modeling methods requires the solution of the aforementioned problem at the atomic level. This requires large computational aids and computational time which makes the development of economical calculation methods urgent. The objective of this volume is the development of such a technique in various nanosystems.

Recent Advances in Nanoscience and Technology Sunil Kumar Bajpai, Murali Mohan Yallapu, 2009. The present Ebook deals with various strategies that have frequently been followed to fabricate nanostructures of required size and shape and with required functionalities to enable them to be used in a wide spectrum of industrial, biomedical and technological applications.

Leading Edge Nanotechnology Research Developments Donald M. Sabatini, 2007. Nanotechnology is briefly introduced as a general term for activities at the level of atoms and molecules about 1/80,000th of a human hair in which there is now intense interest. International contributors to a dozen illustrated chapters elaborate on research progress involving a variety of nanomaterials and their applications in electronics, new materials development and biomedicine, e.g. nanofluids that have unique thermal properties, nanoscale optical effects, nanowires for advanced electronics, nanotubes of self organized inorganic structures, polymer nanocrystal interfaces for potentially producing low cost flexible solar cells and other new methods. A theoretical paper presents the concept of super carbon nanotube. No background information is provided on the editor.

Self-Assembly of Nanostructures Stefano Bellucci, 2011-10-26. This is the third volume in a series of books on selected topics in Nanoscale Science and Technology based on lectures given at the well known Istituto Nazionale di Fisica Nucleare (INFN) schools of the same name. The present set of notes stems in particular from the participation and dedication of prestigious lecturers such as Nunzio Motta, Fulvia Patella, Alexandr Toropov and Anna Sgarlata. All lectures have been carefully edited and reworked taking into account extensive follow up discussions. A tutorial lecture by Motta et al. presents the analysis of the Poly(3-hexylthiophene) self assembly on carbon nanotubes and discusses how the interaction between the two materials forms a new hybrid nanostructure with potential application to future solar cells technology. In their contribution, Patella et al. review quantum dots of III-V compounds which offer appealing perspectives for more sophisticated applications in new generation devices such as single photon emitters for nano photonics and quantum computing. Focusing on self assembled quantum dots, the chapter by Alexandr Toropov et al. provides a comprehensive review of some important aspects in the formation of quantum dots and presents the results of the authors' extensive investigation of the features of droplet epitaxy. The fourth contribution by Sgarlata et al. focuses on recent progress toward controlled growth of self

assembled nanostructures dealing with the shaping ordering and localization in Ge Si heteroepitaxy and reviewing recent results on the self organization of Ge nanostructures at Si surfaces
