

A Novel Photosynthetic Biohybrid System for Microenvironment Regulation of Diabetes Retinopathy through Continuous Oxygen Supply and Nanozyme Cascade Reaction

Liyang Zhou, Kaiyue Lan, Xiaomin Huang, Yuyan Huang, Yingying Jin, Si Lu, Yishun Guo, Lili Su, Yaou Peng, Zhennv Deng, Jianhua Yang, Siyuan Qian, Wanqing Lou, Xiaoying Chu, Hanwen Guo, and Bailiang Wang*

According to International Diabetes Federation Diabetes Atlas statistics, diabetic retinopathy (DR) is the leading cause of vision loss in blinding diseases. The underlying cause of retinal vasculopathy progression in diabetic patients is hyperglycemia and hypoxia features in microvascular region. Hence, cyanobacteria are used as carriers to load both gold nanoparticles (Au NPs) with glucose oxidase-like activity and iridium nanoparticles (Ir NPs) with catalase-like activity, respectively (Cyano@Au@Ir). The Au NPs nanozyme first degrades glucose into hydrogen peroxide, which is further decomposed into H_2O and O_2 by the Ir NPs to complete the cascade hypoglycemic reaction. Based on the unique light transmittance of eyeball and the accumulation of light in the retinal area, the sustainable O_2 production by Cyano greatly alleviates the hypoxia of microenvironment, leading to the decrease of angiogenic growth factor and hypoxia-inducible factor expressions. Simultaneously, the highly expressed peroxide in the DR microenvironment can also be eliminated by Ir NPs for anti-inflammatory property. Furthermore, it is demonstrated in DR animal model that Cyano@Au@Ir significantly reduces neovascular progression and vascular leakage. This novel treatment mode fundamentally degrades blood glucose, continuously supplies O_2 , and scavenges free radicals for comprehensive microenvironment regulation, providing inspirations for solving fundus complications of DR.

1. Introduction

Diabetes is one of the most common and intractable chronic metabolic diseases. By 2021, 537 million people worldwide suffer from diabetes, and one person will die from it every 5 s.^[1] Acute complications of diabetes include diabetic ketoacidosis, hyperglycemia, hyperosmolality, lactic acidosis, etc. The pathogenesis is mainly due to severe lack of insulin activity and inappropriate elevation of glucocorticoid, resulting in hyperglycemia, which leads to disturbance of glucose, fat, and protein metabolism, and imbalance of water, electrolyte, and acid-base balance in the body. Chronic complications mainly including macrovascular and microvascular diseases, as well as neuropathy, are the main cause of disability and death in diabetes. Among them, diabetic retinopathy (DR) is one of the main microvascular complications, leading to a blindness rate up to 30%. Epidemiological surveys show that about 75–80% of diabetic patients who neglect blood glucose organization will develop DR within 15 years. As for the pathogenesis
