REGULATORY MECHANISMS OF NEOPLASTIC CELL GROWTH

Prashant Trikha, Monica Thakar, Conrad Russell Cruz

Regulation of Human Cancer by Cytokines Fumimaro,1993-08-31 This book considers clinical problems associated with new modalities of cancer treatment involving recombinant cytokines The first half of the book is devoted to various types of associations of cytokines with tumor cells while the second half addresses the therapeutic potential of multidisciplinary devices in biological treatment with recombinant cytokine Some of these indicate the future direction of cancer treatment

Candéias, Udo S. Gaipl, Benjamin Frey, 2018-05-03 For long high dose ionizing radiation was considered as a net immune suppressing agent as shown among others by the exquisite radiosensitivity of the lymphoid system to radiation induced cell killing However recent advances in radiobiology and immunology have made this picture more complex For example the recognition that radiation induced bystander effects share common mediators with various immunological signalling processes suggests that they are at least partly immune mediated Another milestone was the finding in the field of onco immunology that local tumor irradiation can modulate the immunogenicity of tumor cells and the anti tumor immune responsiveness both locally in the tumor microenvironment and at systemic level These observations

paved the way for studies exploring optimal combinations of radiotherapy and immunotherapy in order to achieve a synergistic effect to eradicate tumors However not all interactions between radiation and the immune system are beneficial as it was recognized that many of radiation induced late side effects are also of immune and inflammatory nature Currently perhaps the most studied field of research in radiation biology is focused around the biological effects of low doses where many of the observed pathophysiological endpoints are due to mechanisms other than direct radiation induced cell killing and are immune related Finally it must not be forgotten that the interactions between the ionizing radiations and the immune system are bi directional and activation of the immune system also influences the outcome of radiation exposure This Research Topic brings together 23 articles and aims to give an overview of the complex and very often contradictory nature of the interactions between ionizing radiation and the immune system Due to its increasing penetrance in the population both through medical diagnostic or environmental sources or during cosmic travel low dose ionizing radiation exposure is becoming a major epidemiological concern world wide Several of the articles within the Research Topic specifically address potential long term health consequences and the underlying mechanisms of low dose radiation exposure A major intention of the Editors was also to draw the attention of the non radiobiological scientific community on the fact that ionizing radiation is by far more than purely an immune suppressing agent Animal Biotechnology L.A. Babiuk, J.P. Phillips, Murray Moo-Young, 2013-10-22 The advent of biotechnology has the potential to develop a variety of novel or better quality products for the treatment of a large number of diseases in livestock In addition as we understand more about the reproductive physiology of animals the potential exists to dramatically increase the productivity of animals through better therapeutics and diagnostics for the control of many infectious diseases Productivity can also be increased through animal breeding strategies including gene transfer micromanipulation of embryos and gamete sex selection As well as being a valuable reference to current knowledge in these areas this first supplement to Comprehensive Biotechnology also looks at societal concerns over the use of antibiotics and chemical residues in meat and milk products which are forcing biotechnologists to investigate more natural means of controlling infection by stimulating the animal s own immune system to combat infection The identification of a variety of cytokines which are involved in regulating immune responses provides opportunities to use the animal s natural defence mechanisms to combat many infections or increase the animal s resistance to such infections These approaches should provide tools for eventual elimination of specific diseases from counties regions or whole continents
