Jarritt,2012-12-06 Recent explorations in the neurosciences have been progressing towards an understanding of the relationship between brain structure and brain function Having passed through an era which may be described as one of a localisationist philosophy in which discrete brain areas were seen to subserve only discrete functions the perspective of brain behaviour relationships has advanced in recent years to an appreciation that a more holistic approach is not only heuristically valid but is also most likely to lead to future advances The close relationship between the mind and the brain has been appreciated since the time of Hippocrates when he opined men ought to know that from nothing else but thence from the brain comes joys delights laughter and sports and sorrows griefs despondency and lamentations and by this same organ we become mad and delirious and fears and terrors assail us In the nineteenth century particularly in France and Germany descriptions of what are now recognised to be independent neurological diseases emerged following empirical clinical observations Investigation led to the identification in many cases of underlying structural abnormalities which could be linked to pathological changes

Directions in Radiopharmaceutical Research and Development Steven J. Mather, 2012-12-06 Radiopharmaceutical research has recently undergone a major change in direction. In past years it has been concerned mainly with the development of perfusion tracers the biodistribution of which reflect the regional blood flow to areas of major organs such as the heart and brain. However a major new direction of interest now lies in the development of receptor binding radio tracers which can be used to perform in vivo characterisation of diseased tissues and it is likely that much of the future research in this field will follow this direction. The difficulties in developing such tracers are considerable. The researcher must first identify a promising target for radiopharmaceutical development. High specific activity radioactive molecules must be designed and synthesised which will both bind to the target receptor with high affinity and also have the physicochemical characteristics which will allow them to reach the target site in sufficient quantity while at the same time showing minimal uptake in non target tissues. Thus the knowledge base required for radiopharmaceutical development has now expanded beyond the limits of radiopharmaceutical chemistry to include aspects of biochemistry molecular biology and conventional drug design. The portfolio of basic knowledge required to support current radiopharmaceutical development is changing and scientists working in this arena need to be trained in this regard. At the same time the very latest developments in the field need to be communicated to the scientific community in order to stimulate the advancement of this exciting new direction of research.
