Counteracting Urban Heat Island Effects in a Global Climate Change Scenario Francesco Musco, 2016-08-30 Urban heat islands are a new type of microclimatic phenomenon that causes a significant increase in the temperature of cities compared to surrounding areas The phenomenon has been enforced by the current trend towards climate change Although experts consider urban heat islands an urgent European Union public health concern there are too few policies that address it The EU carried out a project to learn more about this phenomenon through pilot initiatives The pilots included feasibility studies and strategies for appropriately altering planning rules and governance to tackle the problem of urban heat islands The pilots were carried out in eight metropolitan areas Bologna Modena Budapest Ljubljana Lodz Prague Stuttgart Venice Padova and Vienna The feasibility studies carried out in these pilot areas focused on the specific morphology of EU urban areas which are often characterised by the presence of historical old towns Heating and Cooling with Ground-Source Heat Pumps in Moderate and Cold Climates, Two-Volume Set Vasile Minea, 2022-07-30

Advanced Power Generation Systems Ibrahim Dincer, Calin Zamfirescu, 2014-07-15 Advanced

Power Generation Systems examines the full range of advanced multiple output thermodynamic cycles that can enable more sustainable and efficient power production from traditional methods as well as driving the significant gains available from renewable sources. These advanced cycles can harness the by products of one power generation effort such as electricity production to simultaneously create additional energy outputs such as heat or refrigeration. Gas turbine based and industrial waste heat recovery based combined cogeneration and trigeneration cycles are considered in depth along with Syngas combustion engines, hybrid SOFC gas turbine engines and other thermodynamically efficient and environmentally conscious generation technologies. The uses of solar power, biomass, hydrogen and fuel cells in advanced power generation are considered within both hybrid and dedicated systems. The detailed energy and exergy analysis of each type of system provided by globally recognized author Dr Ibrahim Dincer will inform effective and efficient design choices while emphasizing the pivotal role of new methodologies and models for performance assessment of existing systems. This unique resource gathers information from thermodynamics, fluid mechanics, heat transfer and energy system design to provide a single source guide to solving practical power engineering problems. The only complete source of info on the whole array of multiple output thermodynamic cycles covering all the design options for environmentally conscious combined production of electric power, heat and refrigeration. Offers crucial instruction on realizing more efficiency in traditional power generation systems and on implementing renewable technologies including solar, hydrogen, fuel cells and biomass. Each cycle description clarified through schematic diagrams and linked to sustainable development scenarios through detailed energy, exergy and efficiency analyses. Case studies and examples demonstrate how novel systems and performance assessment methods function in practice.

The Climate Diet Jonathan Harrington, 2012-05-04 The atmosphere is getting fat on our carbon and other greenhouse gas emissions and it needs our help. We live in a world of excess consuming too much of everything: food, clothes, cars, toys, shoes, bricks and mortar. Our bingeing is often so extreme that it threatens our own health and wellbeing. And we are not the only ones who are getting sick. The Earth which provides the food, air, water and land that sustains us is also under severe pressure. We either take steps to put our personal and planetary systems back into balance or we suffer the consequences. So what does any unhealthy, overweight person do when the doctor tells him or her that they are eating themselves into an early grave? Go on a diet. This is the must have guide to the most important diet ever explaining climate change concepts, problems and solutions in ways that anyone can easily understand. Following a six step climate diet plan, families will be able to count their carbon calories and learn how to reduce them, leaving us with a slim, healthy planet now and for the future.

Design of Heat Exchangers for Heat Pump Applications Marco Fossa, Antonella Priarone, 2020-12-28 Heat pumps (HPs) allow for providing heat without direct combustion in both civil and industrial applications. They are very efficient systems that by exploiting electrical energy greatly reduce local environmental pollution and CO₂ global emissions. The fact that electricity is a partially renewable resource and because the coefficient of

performance COP can be as high as four or more means that HPs can be nearly carbon neutral for a full sustainable future. The proper selection of the heat source and the correct design of the heat exchangers is crucial for attaining high HP efficiencies. Heat exchangers also in terms of HP control strategies are hence one of the main elements of HPs and improving their performance enhances the effectiveness of the whole system. Both the heat transfer and pressure drop have to be taken into account for the correct sizing especially in the case of mini and micro geometries for which traditional models and correlations can not be applied. New models and measurements are required for best HPs system design including optimization strategies for energy exploitation, temperature control and mechanical reliability. Thus a multidisciplinary approach of the analysis is requested and become the future challenge.
