Mulholland, 2012-12-06 The progress of science during the past centuries has been in some measure energized by the development of new technologies People are no more intelligent now than they were five centuries ago or indeed five millenia ago The differences are in the pool of past experience and the availability of means for manipulating the physical and mental environment Until fairly recently the development of new technologies in astronomy and geodesy has served primarily either to broaden the scope of phenomena that could be studied or to improve the precision with which one could examine already studied phenomena There seemed to be no likelihood that a situation could arise similar to that in particle physics where the uncertainty principle indicates that the observation of the state of an object alters that state affecting the observation Indeed we have not yet reached that point but certain of the new techniques have introduced a degree of complication and inter dependence perhaps not previously encountered in the macro sciences When observational capability is so fine that the data can be corrupted by the tidal motions of the instruments for example then there are a myriad of physical effects that must be considered in analyzing the data the happy aspect of this is that the data can be used to study exactly these same effects The complication does not however extend only to predictive computations against which the data are compared

Siegfried Böhme, Ute Esser, Walter Fricke, Inge Heinrich, Dietlinde Krahn, Lutz D. Schmadel, Gert Zech, 2013-03-14 Astronomy and Astrophysics Abstracts which has appeared in semi annual volumes since 1969 is devoted to the recording summarizing and indexing of astronomical publications throughout the world It is prepared under the auspices of the International Astronomical Union according to a resolution adopted at the 14th General Assembly in 1970 Astronomy and Astrophysics Abstracts aims to present a comprehensive documentation of literature in all fields of astronomy and astrophysics Every effort will be made to ensure that the average time interval between the date of receipt of the original literature and publication of the abstracts will not exceed eight months This time interval is near to that achieved by monthly abstracting journals compared to which our system of accumulating abstracts for about six months offers the advantage of greater convenience for the user Volume 20 contains literature published in 1977 and received before February 20 1978 some older literature which was received late and which is not recorded in earlier volumes is also included We acknowledge with thanks contributions to this volume by Dr J Bouška Prague who surveyed journals and publications in Czech and supplied us with abstracts in English and by Prof P Brosche Bonn who supplied us with literature concerning some border fields of astronomy

**Quantum Optics, Experimental Gravity, and Measurement Theory**

Pierre Meystre, Marian O. Scully, 2012-12-06 This volume contains the Proceedings of the NATO Advanced Study Institute Quantum Optics and Experimental General Relativity which was held in Bad Windsheim Federal Republic of Germany from August 16 to 29 1981 At first glance one might wonder

why a meeting should cover these two topics and a good bit of quantum measurement theory as well all of which seem to be completely unrelated The key to what one may call this grand unification lies in the effort underway in a number of laboratories around the world to detect gravitational radiation Present research is pursuing the development of two types of detectors laser interferometers and resonant bar detectors Because the signals that one is trying to measure are so weak the quantum mechanical nature of the detectors comes into play The analysis of the effects which result from this is facilitated by the use of techniques which have been developed in quantum optics over the years This analysis also forces one to confront certain issues in the quantum theory of measurement The laser interferometer detectors using as they do light are clearly within the realm of subjects usually considered by quantum optics For example the analysis of the noise present in such a detector can make use of the many techniques which have been developed in quantum optics Scientific and Technical Aerospace Reports ,1994-03

**SCIENTIFIC APPLICATIONS OF LUNAR LASER RANGING- PROCEEDINGS OF A SYMPOSIUM- INTERNATIONAL UNION OF GEODESY AND GEOPHYSICS- INTERNATIONAL ASTRONOMICAL UNION- COSPAR- THE ICSU COMMITTEE ON SPACE RESEARCH. , Tidal Friction and the Earth's Rotation**

Peter Brosche,2013-12-01 P Brosche The development of the ideas and observational techniques related to the subject of our meeting Tidal friction and the Earth's rotation Bielefeld September 1977 is one of the most fascinating books not merely chapters of the modern history of science Its genealogical tree is as intricate as that of mankind itself There are dead ends and superfluous re discoveries Due to these circumstances and to the pure extent of the topic it is impossible to give more than a few highlights here The first relevant observational fact was discovered by the famous English astronomer E Halley in 1695 Berry 1961 He simply could not arrive at an agreement between ancient and recent eclipses using a constant mean angular motion of the Moon Instead he had to introduce an empirical acceleration term in the mean motion Known as the secular acceleration it has ever since been a most challenging subject of celestial mechanics and a main branch of the genealogical tree already mentioned In 1754 completely independently and almost certainly in ignorance of those specialists activities the German philosopher Kant established the idea of tidal friction as a decelerating mechanism for the rotation of the Earth Felber 1974 Although he made some errors in his rough computations the majority of the constitutive elements of his concept have survived to the present day Brosche 1977 *Time and the Earth's Rotation* D.D. McCarthy,J.D.H. Pilkington,2012-12-06 IAU Symposium No 82 Time and the Earth's Rotation met to discuss modern research in the field of the rotation of the Earth with particular emphasis on the role of new observational techniques in this work The use of these techniques has prompted a new look at the definitions of the traditional reference systems and the concepts of the rotation of the Earth around its center of mass Specific topics discussed were time polar motion reference systems conventional radio interferometry very long baseline interferometry VLBI Doppler satellite methods satellite laser ranging lunar laser ranging and geophysical research concerning the Earth's rotation Improvement in the accuracy of the

observations is a key to possible solutions of the many unsolved problems remaining in this field. It appears that such improvement using both classical and new techniques is forthcoming in the near future. This will surely contribute to a better understanding of some of the long standing questions concerning the rotation of the Earth around its center of mass and lead to an improved knowledge of the rotating deformable Earth. This volume contains the papers presented at IAU Symposium No 82 as well as the discussions provoked by these papers. It is hoped that it captures the principal points of the meeting and that it will contribute not only to a better understanding of existing problems but also to future research in time and the Earth's rotation. **Low-Frequency Geodynamics** Roman Teisseyre, 2013-10-22. This fourth volume in the series Physics and Evolution of the Earth's Interior provides a comprehensive review of the geophysical and geodetical aspects related to gravity and low frequency geodynamics. Such aspects include the Earth's gravity field, geoid shape, theory and low frequency phenomena like rotation oscillations and tides. Global scale phenomena are treated as a response to source excitation in spherical Earth models consisting of several shells: lithosphere, mantle, core, and sometimes also the inner solid core. The effect of gravitation and rotation on the Earth's shape is analysed. The satellite approach to studies of the gravity field and the geoid shape is discussed in some detail. Discussions of recent findings and developments are accompanied by a brief historical background.

1978 NASA Authorization United States. Congress. House. Committee on Science and Technology. Subcommittee on Space Science and Applications, 1977. The Century of Space Science J.A. Bleeker, Johannes Geiss, M. Huber, 2012-12-06. One of the most attractive features of the young discipline of Space Science is that many of the original pioneers and key players involved are still available to describe their field. Hence at this point in history we are in a unique position to gain first hand insight into the field and its development. To this end The Century of Space Science, a scholarly authoritative reference book, presents a chapter by chapter retrospective of space science as studied in the 20th century. The level is academic and focuses on key discoveries, how these were arrived at, their scientific consequences, and how these discoveries advanced the thoughts of the key players involved. With over 90 world class contributors such as James Van Allen, Cornelis de Jager, Eugene Parker, Reimar Lüst and Ernst Stuhlinger, and with a Foreword by Lodewijk Woltjer, past ESO Director General, this book will be immensely useful to readers in the fields of space science, astronomy, and the history of science. Both academic institutions and researchers will find that this major reference work makes an invaluable addition to their collection. Contributions of Space Geodesy to Geodynamics David E. Smith, Donald L. Turcotte, 1993-01-11. Published by the American Geophysical Union as part of the Geodynamics Series Volume 24. There are times in the history of a science when the evolving technology has been combined with a singleness of purpose to make possible the next great step. For space geodesy, the decade of the 1980s was one of those times. Initiated in the early 1980s, the NASA Crustal Dynamics Project (CDP), a global venture of unprecedented proportions, exploited new technologies to confirm and refine tectonic theories and to advance geodynamics.

The highlights of the efforts of scientists and engineers from some 30 countries are contained in the 54 papers collected in three volumes which are dedicated to the memory of Edward A Ted Flinn the former Chief Scientist of the NASA Geodynamics Program      Publications of the National Bureau of Standards United States.
