Scientists Starred, 1903-1943, in "American Men of Science" Stephen Sargent Visser, 1947 **The American Ideology of National Science, 1919-1930** Ronald C. Tobey, 1971-10-15 Ronald C Tobey provides a provocative analysis of the movement to establish a national science program in the early twentieth century Led by several influential scientists who had participated in centralized scientific enterprises during World War I the new effort to conjoin science and society was an attempt to return to earlier progressive values with the hope of producing science for society's benefit The movement was initially undermined by the new physics and Einstein's theories of relativity which shattered traditional views and alienated the American public Nationalized research programs were tempered by the conservatism of corporate donors Later with the disintegration of progressivism the gap between science and society made it impossible for the two cultures to unite The Command of Light George Kean Sweetnam, 2000 Henry Rowland 1848 1901 was one of the most important figures in the founding of modern physics in the U S A principal founder and first pres of the Amer Physical Soc he is best known for his invention of the concave spectral grating for which he won a gold medal and grand prize at the 1890 Paris Exposition A grad of Rensselaer Polytechnic Inst in civil engineering Rowland was prof of physics at Johns Hopkins Univ where he had the principal part in forming the first school of Amer physicists to be professionally trained in the U S In this vol Sweetnam using Rowland's papers and those of his colleagues and students has written the first scholarly exposition of Rowland's work

The New Era in American Mathematics, 1920-1950 Karen Hunger Parshall, 2022-02-22 The 1920s witnessed the birth of a serious mathematical research community in America Prior to this mathematical research was dominated by scholars based in Europe but World War I had made the importance of scientific and technological development clear to the American research community resulting in the establishment of new scientific initiatives and infrastructure Physics and chemistry were the beneficiaries of this renewed scientific focus but the mathematical community also benefitted and over time began to flourish Over the course of the next two decades despite significant obstacles this constellation of mathematical researchers programs and government infrastructure would become one of the strongest in the world In this meticulously researched book Karen Parshall documents the uncertain but ultimately successful rise of American mathematics during this time Drawing on research carried out in archives around the country and around the world as well as on the secondary literature she reveals how geopolitical circumstances shifted the course of international mathematics She provides surveys of the mathematical research landscape in the 1920s 30s and 40s introduces the key players and institutions in mathematics at that time and documents the effect of the Great Depression and the second world war on the international mathematical community The result is a comprehensive account of the shift of mathematics center of gravity to the American stage

American Geography and Geographers Geoffrey J. Martin, 2015 The rise of American geography as a distinctive science in the United States straddles the 19th and 20th centuries extending from the post Civil war period to 1970 American Geography and Geographers Toward Geographic Science is the first book to thoroughly and richly explicate this history Its author Geoffrey J Martin the foremost historian on the subject and official archivist of the Association of American Geographers amassed a wealth of primary sources from archives worldwide which enable him to chart the evolution of American geography with unprecedented detail and context From the initial influence of the German school to the emergence of Geography as a unique discipline in American universities and thereafter Martin clarifies the what how and when of each advancement Expansive discussion of the arguments made controversies ignited and research voyages move hand in hand with the principals who originated and animated them Davis Jefferson Huntington Bowman Johnson Sauer

Hartshorne and many more. From their grasp of local, regional, global and cultural phenomena, geographers also played pivotal roles in world historical events including the two world wars and their treaties as the US became the dominant global power. *American Geography and Geographers Toward Geographical Science* is a conclusive study of the birth and maturation of the science. It will be of interest to geographers, teachers and students of geography and all those compelled by the story of American Geography and those who founded and developed it. *Women of Science* Gabriele Kass-Simon, Patricia

Farnes, Deborah Nash, 1993. *Women of Science* is a collection of essays dealing with contributions women have made to various scientific disciplines written by women scientists in those disciplines. The areas covered are astronomy, archaeology, biology, chemistry, crystallography, engineering, geology, mathematics, medicine and physics. The women who have written these essays are for the most part not professional historians but rather scientific professionals who felt the necessity of researching the contributions women have made to the development of their fields. The essays are unique not only because they recover lost women who made significant contributions to their disciplines but also because they are written with a depth of understanding that only a scientist working in a specific area can have. The essays will be of interest not only to students, especially women students of science who may be unaware of the many contributions women have made but also to readers of the history of science whose texts more often than not fail to include the work of most women scientists.

American Scientist, 1947. *Complexity* Nicholas Rescher, 2020-02-14. Our world is enormously sophisticated and nature's complexity is literally inexhaustible. As a result, projects to describe and explain natural science can never be completed. This volume explores the nature of complexity and considers its bearing on our world and how we manage our affairs within it. Rescher's overall lesson is that the management of our affairs within a socially, technologically and cognitively complex environment is plagued with vast management problems and risks of mishap. In primitive societies, failure to understand how things work can endanger a family or at worst a clan or tribe. In the modern world, man-made catastrophes on the model of Chernobyl can endanger millions, possibly even risking the totality of human life on our planet. Rescher explains technological escalation as a sort of arms race against nature in which scientific progress requires more powerful technology for observation and experimentation and conversely scientific progress requires the continual enhancement of technology. The increasing complexity of science and technology and in consequence of social systems along with problems growing faster than solutions confront us with major management and decision problems. This study is the first of its kind. There have been many specialized studies of complexity in physics and computation theory but no overall analysis of the phenomenon. Although Rescher offers a sobering outlook, he also believes that complexity entails mixed blessings; our imperfect knowledge provides a rationale for putting forth our best efforts. Rescher urges us to gear the conduct of life's practical affairs to the demands of a complex world. This highly readable and accessible volume will be of interest to those interested in philosophy, the philosophy of science, science policy studies and future studies. *Epistemology* Nicholas Rescher, 2003-10-09.
