Scifi 93 - Proceedings Of The Scintillating Fiber Detectors Alan D Bross, Mitchell R Wayne, Randal C Ruchti, 1995-03-07
These proceedings contain over 80 contributions from an international group of scientists and engineers actively working on applications of fiber technology in high energy physics and related fields Sessions included reviews of past current and possible future detectors incorporating fiber technology for tracking and calorimetry Special sessions covered photodetection techniques including VLPCs APDs and hybrid phototubes recent advances in fiber structure optical interconnection and mechanical support and scintillation materials including new developments in scintillation dyes and studies of radiation and environmental effects Technical advances have been rapid in this promising area of detector development and the SciFi93 proceedings serve as a useful reference on the state of the art **Scintillating Fiber Detectors**, 1994 **SCIFI 93, Workshop on Scintillating Fiber Detectors, October 24-28, 1993, Notre Dame, Indiana, U.S.A.** Alan D. a semiconductor laser and a light emitting diode LED have been a field of intense research for more than a decade This research monograph discusses recent research activities in nonclassical light generation based on semiconductor devices performed mostly at Stanford University When a semiconductor material is used as the active medium to generate photons as in semiconductor lasers and LEDs the flow of carriers electrons and holes is converted into a flow of photons Provided that the conversion is fast and efficient the statistical properties of the carriers pump noise can be transferred to the photons if pump noise can be suppressed to below the shot noise value the noise in the photon output can also be suppressed below the Poisson limit Since electrons and holes are fermions and have charges the statistical properties of these particles can be significantly different from those of photons if the structure of the light emitting device is properly designed to provide interaction between these particles There has been a discrepancy between the theoretical understanding and experimental observation of noise in a macroscopic resistor until very recently The dissipation that electrons experience in a resistor is expected to accompany the fluctuation due to partition noise leading to shot noise in the large dissipation limit as is the case with photons Experimental observation shows that thermal noise expected only in a thermal equilibrium situation zero bias condition is the only source of noise featured by a resistor dependent of the current
