Regulation And Control In Living Systems:

Regulation and Control in Living Systems Hans Kalmus,1967 *Principles of Biological Regulation* Richard Jones,2012-12-02 *Principles of Biological Regulation* An Introduction to Feedback Systems presents some understanding of control regulatory and feedback mechanisms in biological systems This book discusses concepts related to the dynamic behavior of both individual biological processes and systems of processes that make up an organism Comprised of 10 chapters the book also describes the characteristics of biological feedback systems focusing on the physical concepts After briefly dealing with involved regulatory processes in biological systems the book goes on discussing the flow or transport of material through a series of processes in the steady state Next chapter uses superposition principle to explain the changes that biological systems undergo following a disturbance or under dynamic behavior The subsequent chapters cover the fundamental principles of negative biological feedback and to the effects it produces both under steady state and dynamic behavior Other chapters describe the effect of sinusoid signals on biological processes and present some stability criteria applied to technological systems and also their value in the study of homeostatic processes The book also discusses some aspects of homeostats that seem to distinguish them from technological feedback systems These features include not only the components themselves and their organization but also the experimental problems involved in their study The concluding chapters describe nonlinear behavior with great relevance to homeostatic systems and rate processes production or destruction for which the roles of stimulus and initial conditions are different Mathematical relations developed from the conservation of mass and the mass action for chemical reactions are also presented The book is an invaluable resource for life scientists and researchers **Thermodynamic Bases of Biological Processes** A. I. Zotin,2013-02-06 No detailed description available for Thermodynamic Bases of Biological Processes *Developing Synthetic Transport Systems* Alexey Melkikh,Maria Sutormina,2013-02-01 Understanding the general laws of an effective system for the transport of substances in cells is an important goal of systems and synthetic biology and will help us to answer why the transport subsystem of a cell is arranged as it is In addition the construction of models for optimizing transport systems is of considerable importance in the early stages in the development of a functioning protocell The aim of this book is to describe the latest techniques for the calculation of the optimal parameters of the transport subsystem of a cell at its maximum efficiency The book will describe linear and nonlinear programming dynamic programming game theory for models of ion transport in different types of cells e g mammalian cells bacteria plants and fungi **Library of Congress Subject Headings** Library of Congress,Library of Congress. Subject Cataloging Division,Library of Congress. Office for Subject Cataloging Policy,2013 *Library of Congress Subject Headings* Library of Congress. Cataloging Policy and Support Office,2007 *Biological Systems: Complexity and Artificial Life* Jacques Ricard,2014-05-06 The exponential increase in computing power in the late twentieth century has allowed researchers to gather process and analyze large volumes of information and construct rational paradigms of systems

Life sciences are no exception and computing advances have led to the birth of fields such as functional genomics and bioinformatics and facilitated an expansion of our understanding of biological systems. *Biological Systems Complexity and Artificial Life* is an essential primer on systems biology for biologists and researchers having a multidisciplinary background. The volume covers a variety of theoretical models explaining biological processes. The book starts with an introductory chapter on the classical molecular biology paradigm and progresses towards concepts related to enzyme kinetics, non-equilibrium dynamics, cellular thermodynamics, molecular motion in cells, and more. The book concludes with a philosophical note on the concept of the biological system.

Waddington, 2017-09-08. *Biological Processes in Living Systems* is the fourth and final volume of the *Toward a Theoretical Biology* series. It contains essays that deal in detail with particular biological processes: morphogenesis of pattern, the development of neuronal networks, evolutionary processes, and others. The main thrust of this volume brings relevance to the general underlying nature of living systems. Faced with trying to understand how the complexity of molecular microstates leads to the relative simplicity of phenome structures, Waddington on behalf of his colleagues stresses on the structure of language as a paradigm for a theory of general biology. This is language in an imperative mood: a set of symbols organized by some form of generative grammar making possible the conveyance of commands for action to produce effects on the surroundings of the emitting and the receiving entities. Biology, he writes, is concerned with algorithm and program. Among the contributions in this volume are: The Riemann-Hugoniot Catastrophe and van der Waals Equation, David H. Fowler, *Differential Equations for the Heartbeat and Nerve Impulse*, E. Christopher Zeeman, *Structuralism and Biology*, Rene Thom, *The Concept of Positional Information and Pattern Formation*, Lewis Wolpert, *Pattern Formation in Fibroblast Cultures*, Tom Elsdale, *Form and Information*, C. H. Waddington, *Organizational Principles for Theoretical Neurophysiology*, Michael A. Arbib, *Stochastic Models of Neuroelectric Activity*, Jack D. Cowan. *Biological Processes in Living Systems* is a pioneering volume by recognized leaders in an ever-growing field.

Humans as Self-Constructing Living Systems Donald H. Ford, 2019-03-04. Originally published in 1987, the purpose of this title was to develop a conceptual framework for understanding individual humans as complex functional entities. It was felt that a sound developmental theory of human personality and behaviour would help synthesize existing scientific and clinical information into a coherent representation of a person as a functional unit, guide future research, and facilitate the work of the health and human services professions. The volume is aimed at a multidisciplinary, multiprofessional audience.

California, Berkeley, 1972 **Introduction to Complexity and Complex Systems** Robert B. Northrop, 2010-12-08 The boundaries between simple and complicated and complicated and complex system designations are fuzzy and debatable even using quantitative measures of complexity However if you are a biomedical engineer a biologist physiologist economist politician stock market speculator or politician you have encountered complex systems Furthermore your success depends on your ability to successfully interact with and manage a variety of complex systems In order not to be blindsided by unexpected results we need a systematic comprehensive way of analyzing modeling and simulating complex systems to predict non anticipated outcomes In its engaging first chapters the book introduces complex systems Campbell's Law and the Law of Unintended Consequences and mathematics necessary for conversations in complex systems Subsequent chapters illustrate concepts via commonly studied biological mechanisms The final chapters focus on higher level complexity problems and introduce complexity in economic systems Designed as a reference for biologists and biological engineers Introduction to Complexity and Complex Systems lends itself to use in a classroom course to introduce advanced students studying biomedical engineering biophysics or physiology to complex systems Engaging and illustrative this book aids scientists and decision makers in managing biological complexity and complex systems Systems Philosophy and Management Kris K Murthy, 1999 Flux Control in Biological Systems Ernst-Detlef Schulze, 2012-12-02 Comprehending and modelling biomass production nutrient and water fluxes in biological systems requires understanding control mechanisms at various levels of organization This new book with 16 pages of four colorplates compares patterns and mechanisms of regulation starting from enzyme reactions and ending at the population and ecosystem level By doing so the book investigates the general principles of how fluxes are adjusted and regulated Such principles are essential for preparing effective models and for predicting human impacts on ecosystems Flux Control in Biological Systems From Enzymes to Populations and Ecosystems will be an essential personal library addition for student and professional environmental biologists ecologists physiologists biochemists botanists microbiologists soil scientists and zoologists as well as anyone who investigate patterns of matter and energy transfer in biological systems of different levels of complexity Presents the mechanisms of flux control Explains the similarities of flux control at various levels of complexity and organization Demonstrates how fluxes are adjusted in complex systems of interacting groups of organisms Principles of Biology Neal Dollison Buffaloe, J. Biological Robustness Marta Bertolaso, Silvia Caianiello, Emanuele Serrelli, 2019-01-04 This volume reviews examples and notions of robustness at several levels of biological organization It tackles many philosophical and conceptual issues and casts an outlook on the future challenges of robustness studies in the context of a practice oriented philosophy of science The focus of discussion is on concrete case studies These highlight the necessity of a level dependent description of robust biological behaviors Experts from the neurosciences biochemistry ecology biology and the history and the philosophy of life sciences provide a multiplex perspective on the topic Contributions span from protein folding to cell level robustness to

organismal and developmental robustness to sensorimotor systems up to the robustness of ecological systems Several chapters detail neurobiological case studies The brain the poster child of plasticity in biology offers multiple examples of robustness Neurobiology explores the importance of temporal organization and multiscale nature in making this robustness with plasticity possible The discussion also includes structures well beyond the brain such as muscles and the complex feedback loops involved in the peculiar robustness of music perception Overall the volume grounds general reflections upon concrete case studies opening to all the life sciences but also to non biological and bio inspired fields such as post modern engineering It will appeal to researchers students as well as non expert readers
