En France, de nombreuses agglomérations utilisent des systèmes d'assainissement unitaire où eaux usées et eaux pluviales sont collectées et évacuées vers des systèmes d'épuration (Passerat et al., 2010). Cependant, lors de fortes pluies, des dispositifs de « surverse » appelés déversoir d'orage (DO), conçus pour éviter le débordement des stations d'épuration et l'inondation des habitations et voiries, rejettent eaux usées et pluviales dans les cours d'eau naturels. Ces rejets de DO peuvent transformer une petite rivière en collecteur d'eaux usées « naturel », véhiculant déchets fécaux, matières solides et particules infectieuses. De par ses activités récréatives et professionnelles, l'homme peut être exposé à des eaux contaminées par des rejets par temps de pluie. Des études épidémiologiques ont montré un risque plus élevé de contraction de gastro-entérite suite à une exposition à des eaux de baignade contaminées par des déchets fécaux (Prüss et al., 1998 ; Zmirou et al., 2003 ; Wade et al., 2005). Ces études ont contribué au développement de modèles d'évaluation quantitative des risques microbiens (QMRA) après intégration de données concernant les relations avec les concentrations en agents pathogènes ou bactéries indicatrices de la contamination fécale (Zmirou et al., 2003 ; Ashbolt et al., 2010 ; Soller et al., 2010). Ces modèles doivent aujourd'hui être alimentés par des jeux de données permettant d'affiner l'estimation des probabilités d'infection en fonction des paramètres environnementaux pouvant affecter l'appréciation des relations dose-réponse. Des facteurs site-spécifiques intégrant la complexité écologique des zones d'exposition aux organismes pathogènes et une différenciation des sources doivent être pris en compte pour obtenir une bonne évaluation des risques (Ashbolt et al., 2010). Les études abordées dans cette note d'actualité scientifique présentent des jeux de données permettant une meilleure appréciation des risques d'exposition aux agents pathogènes et des probabilités d'infection lors d'une utilisation des masses d'eau à des fins récréatives.

Impact d'un événement intense de rejets d'eaux par temps de pluie par un déversoir d'orage sur la qualité microbiologique de la Seine

Passerat S, Ouarda NK, Mouchel JM, Becker V, Servais P. Impact of an intense combined sewer overflow event on the microbiological water quality of the Seine river. Water Res. 2010; 45: 893-903.

Analyse

Une analyse comparative de la qualité microbiologique d'un cours d'eau par temps sec et lors d'un événement de rejets de déversoir d'orage (DO) par temps de pluie, est présentée dans cet article (Passerat et al., 2010). L'événement de déversement analysé a eu une durée de 6 heures. La stratégie d'échantillonnage et les volets météorologiques visaient à définir la zone d'impact, en termes de km, d'un DO, le rôle des matières en suspension dans le transport des bactéries-indicatrices de contaminations fécales, et l'impact relatif des eaux usées sur leurs concentrations dans les rejets d'un DO. Douze séries d'échantillons d'eaux rejetées par le DO, et des eaux de quatre secteurs de la Seine réparties sur 25 km, dont 1 en amont du DO et 3 en aval, ont été analysées. Des prélevements d'eaux de la Seine et d'eaux usées par temps sec ont servi de référence. La conductivité a été utilisée comme

indicateur des proportions d'eaux usées et pluviales rejetées par le DO. Les eaux usées ont constitué 10 % en moyenne, et 40 % lors des 30 premières minutes, des rejets du DO. De façon similaire, les concentrations en matière en suspension (MES) des eaux rejetées par le DO suggèrent des apports extérieurs en provenance des eaux pluviales de l'ordre de 86 %. Cependant, lors des 30 premières minutes de rejets, les fortes concentrations en MES observées étaient plus probablement reliées à une remise en suspension de dépôts présents dans le collecteur d'égout. Les concentrations en indicateurs fécaux ont également suivi ces tendances, avec des concentrations plus élevées en début de période de rejets et des concentrations variant en fonction du mélange Eaux Usées/Eaux Pluviales. Sur la période de rejets, environ 50 % *E. coli* ont été déversées dont 77 % étaient adsorbées sur les MES. Selon les auteurs, la remise en suspension des dépôts (sédiments) du réseau unitaire aurait contribué à hauteur de 45 % et 65 % de la charge en *E. coli* et en entérocoques intestinaux, respectivement. Les concentrations en bactéries indicatrices de contaminations fécales dans les eaux de la Seine, lors de l'événement de rejets du DO, ont augmenté d'environ un log entre l'amont et laval du DO, démontrant un impact significatif du DO. Les concentrations pour les eaux collectées jusqu'à une distance

Cities of the Future Vladimir Novotny,Paul Brown,2007-09-04 This book is developed from and includes the presentations

of leading international experts and scholars in the 12-14 July 2006 Wingspread Workshop. With urban waters as a focal point this book will explore the links between urban water quality and hydrology and the broader concepts of green cities and smart growth. It also addresses legal and social barriers to urban ecological sustainability and proposes practical ways to overcome those barriers. Cities of the Future features chapters containing visionary concepts on how to ensure that cities and their water resources become ecologically sustainable and are able to provide clean water for all beneficial uses. The book links North American and Worldwide experience and approaches. The book is primarily a professional reference aimed at a wide interdisciplinary audience including universities, consultants, environmental advocacy groups and legal environmental professionals.

Chemical Water and Wastewater Treatment III Rudolf Klute, Hermann H. Hahn, 2012-12-06 Exactly ten years ago an experiment was started that proved to be extremely successful the First Gothenburg Symposium. Its intent was to further the understanding of all processes pertaining to Chemical Water and Wastewater Treatment and to bring together specialists working in basic research as well as in development and administration. Now the Proceedings of the Sixth Symposium are about to be published clearly proving that there is a need for this forum. They dramatically illustrate the significance and the dynamic development of the topics of these symposia. It is fascinating to witness that in this time of reduced economic growth or even standstill the environmental drive has not come to a halt as many anticipated or feared. It is accepted more and more that the protection of the environment a constant theme in all the Gothenburg Symposia is not only a topic to be dealt with in times of affluence it is now also seen as an instrument for cutting expenditure saving energy and husbanding resources. The ever growing interest in these Gothenburg Symposia documented by the large number of contributions the scientific panel received and the large demand for the books of this series that always exceeds the supply testify to this commitment.

Groundwater Quality and Geochemistry in Arid and Semi-Arid Regions Shakir Ali, Abdelazim Negm, 2024-03-19 This book reviews groundwater quality and its major global contaminants and collects the latest advances in the analysis, remediation, risk assessment and hydrogeochemistry of groundwater in countries such as Algeria, Egypt, Ghana, Kazakhstan, Morocco, Saudi Arabia and the USA. This book mainly

focuses on the major arid and semi arid areas where groundwater is scarce and highly polluted with geogenic and anthropogenic contaminants and the recharge to the groundwater is negligible due to limited rainfall Divided into 2 parts the book starts by covering topics like assessment and protection of groundwater in arid and semi arid regions groundwater pollution and contamination risk assessment Particular attention is given to the application of environmental isotopes in groundwater studies and how anthropogenic activities impact groundwater quality the impact of irrigation reservoirs in groundwater and soil quality and how artificial intelligence is applied to forecast groundwater quality In the second part of this book readers will find more about the major global contaminants of groundwater in arid and semi arid areas including a geochemical analysis of fluoride and nitrate contamination Supported by regional case studies this book appeals to researchers scholars and professionals working in the field of groundwater contamination and remediation and is also an important account for policymakers
