High Density Digital Recording K.H.J Buschow, G.J Long, F. Grandjean, 2012-12-06 High density digital magnetic and magneto optical storage devices are widely used in audio video and data processing information technology as well as in CAD CAM computer systems These widespread uses generate a continually increasing demand for both increased information storage densities and capacities and for reduced access times Hence the materials engineering of high density storage media with a high signal to noise ratio and the associated design of sophisticated read and write heads form the basis of major technological research This research is especially complex because ideally the recorded information should be both erasable and at the same time secure and accessible over periods of many decades As a result research on these complex problems requires a multidisciplinary approach which utilizes the expertise in such widely differing fields as organic inorganic and solid state chemistry metallurgy solid state physics electrical and mechanical engineering and systems analysis Often further research specialization is necessary in each of these different disciplines For instance solid state physics and chemistry address the problems of crystallographic structure

and phase diagram determination magnetism and optics but more advanced research methods such as high resolution electron microscopy and electronic band structure calculations are necessary to understand the microstructure of particulate recording media or the electronic spectra of magneto optical recording media
