Rheology And Deformation Of The Lithosphere At Continental Margins:

Rheology and Deformation of the Lithosphere at Continental Margins Garry D. Karner, Brian Taylor, Neal W.

Driscoll, David L. Kohlstedt, 2004-03-24 Traditionally investigations of the rheology and deformation of the lithosphere the rigid or mechanically strong outer layer of the Earth which contains the crust and the uppermost part of the mantle have taken place at one scale in the laboratory and at an entirely different scale in the field Laboratory experiments are generally restricted to centimeter sized samples and day or year length times while geological processes occur over tens to hundreds of kilometers and millions of years The application of laboratory results to geological systems necessitates extensive extrapolation in both temporal and spatial scales as well as a detailed understanding of the dominant physical mechanisms The development of an understanding of large scale processes requires an integrated approach This book explores the current cutting edge interdisciplinary research in lithospheric rheology and provides a broad summary of the rheology and deformation of the continental lithosphere in both extensional and compressional settings Individual chapters explore contemporary research resulting from laboratory observational and theoretical experiments **The Afar Volcanic**

Province Within the East African Rift System G. Yirgu, Cindy J. Ebinger, P. K. H. Maguire, 2006 The seismically and volcanically active East African Rift System is an ideal laboratory for continental break up processes it encompasses all stages of rift development Its northernmost sectors within the Afar volcanic province include failed rifts nascent sea floor spreading and youthful passive continental margins associated with one or more mantle plumes A number of models have been proposed to explain the success and failure of continental rift zones but there remains no consensus on how strain localizes to achieve rupture of initially 125 250 km thick plates or on the interaction between the plates and asthenospheric processes This collection of papers provides new structural stratigraphic geochemical and geophysical data and numerical models needed to resolve fundamental questions concerning continental break up and mantle plume processes The focus is on how mantle melt intrudes and is distributed through the plate and how this magma intrusion process controls along axis segmentation and facilitates break up **Tectonics of the Deccan Large Igneous Province** S. Mukherjee, A.A. Misra, G.

Calvès, M. Nemčok, 2017-03-31 Understanding the Deccan Trap Large Igneous Province in western India is important for deciphering the India Seychelles rifting mechanism This book presents 13 studies that address the development of this province from diverse perspectives including field structural geology geochemistry analytical modelling geomorphology and geophysics e g palaeomagnetism gravity and magnetic anomalies and seismic imaging Together these papers indicate that the tectonics of Deccan is much more complicated than previously thought Key findings include the Deccan province can be divided into several blocks the existence of a rift induced palaeo slope constraints on the eruption period rift drift transition mechanisms determined for magma rich systems the tectonic role of the Deccan or R union plumes sub surface structures reported from boreholes the delineation of the crust mantle structure the documentation of sub surface tectonic boundaries

Geology of the Earthquake Source Åke Fagereng, Virginia G. Toy, Julie V. Rowland, 2011 Professor Richard Rick Sibson revolutionized structural geology by illustrating that fault rocks contain an integrated record of earthquakes Fault rock textures develop in response to geological and physical variables such as composition environmental conditions e.g. temperature and pressure fluid presence and strain rate These parameters also determine the rate and state variable frictional stability of a fault the dominant mineral deformation mechanism and shear strength and ultimately control the partitioning between seismic and aseismic deformation This volume contains a collection of papers that address the geological record of earthquake faulting from field based or theoretical perspectives

Plate Boundaries and Natural Hazards Joao C. Duarte, Wouter P. Schellart, 2016-07-13 The beginning of the new millennium has been particularly devastating in terms of natural disasters associated with tectonic plate boundaries such as earthquakes in Sumatra Chile Japan Tahiti and Nepal the Indian Ocean and the Pacific Ocean tsunamis and volcanoes in Indonesia Chile Iceland that have produced large quantities of ash causing major disruption to aviation In total half a million people were killed by such natural disasters These recurring events have increased our awareness of the destructive power of natural hazards and the major risks associated with them While we have come a long way in the search for understanding such natural phenomena and although our knowledge of Earth dynamics and plate tectonics has improved enormously there are still fundamental uncertainties in our understanding of natural hazards Increased understanding is crucial to improve our capacity for hazard prediction and mitigation Volume highlights include Main concepts associated with tectonic plate boundaries Novel studies on boundary related natural hazards Fundamental concepts that improve hazard prediction and mitigation Plate Boundaries and Natural Hazards will be a valuable resource for scientists and students in the fields of geophysics geochemistry plate tectonics natural hazards and climate science Read an interview with the editors to find out more <https://eos.org/editors-vox/plate-boundaries-and-natural-hazards>

Tectonic Development, Thermal History and Hydrocarbon Habitat Models of Transform Margins: their Differences from Rifted Margins M. Nemčok, H. Doran, A. G. Doré, L. Ledvényiová, S. Rybár, 2023-07-21 Transform margins form a significant portion of Earth's continent-ocean transition and are integral to continental break-up yet compared to other margins are poorly understood. This volume brings together new multidisciplinary research to document the structural, sedimentological and thermal evolution of transform margins highlighting their relationship to continental structure neighbouring oceanic segments pull apart basins and marginal plateaus. Special emphasis is given to the comparison of transform and rifted margins and to the economic implications of transform margin structure and evolution. Transform case studies include the Agulhas, Falkland, transform, Coromandel, transform, East India, Davie margin and Limpopo transform, East Africa, Guyana transform margin, Demerara transform margin, Suriname, Romanche and St Paul transforms, equatorial Africa, Sagaiing transform, Andaman Sea and Zenith, Wallaby, Perth transform, West Australia. The broad scale interplay between transform and rifted margin segments in the North and Central Atlantic and Caribbean is also examined.

Conjugate Divergent Margins Webster Mohriak, Al Danforth, Paul J. Post, G. C. Tari, Michal Nemčok, Sudipta T. Sinha, 2013 The main focus of the book is the geological and geophysical interpretation of sedimentary basins along the South Central and North Atlantic conjugate margins but concepts derived from physical models, outcrop analogues and present day margins are also discussed in some chapters. There is an encompassing description of several conjugate margins worldwide based on recent geophysical and geological datasets. An overview of important aspects related to the geodynamic development and petroleum geology of Atlantic type sedimentary basins is also included. Several chapters analyse genetic mechanisms and break-up processes associated with rift phase structures and salt tectonics providing a full description of conjugate margin basins based on deep seismic profiles and potential field methods.

Regional Geology and Tectonics David G. Roberts, A.W. Bally, 2012-12-31 Volume 1A Principles of Geologic Analysis A how-to primer describes the basic concepts petroleum geologists and students need to understand hydrocarbon exploration in a broad range of geological settings globally. The Internal Structure of Fault Zones Christopher A. J. Wibberley, 2008 Faults are primary focuses of both fluid migration and deformation in the upper crust The recognition that faults are typically heterogeneous zones of deformed material not simple discrete fractures has fundamental implications for the way geoscientists predict fluid migration in fault zones as well as leading to new concepts in understanding seismic aseismic strain accommodation This book captures current research into understanding the complexities of fault zone internal structure and their control on mechanical and fluid flow properties of the upper crust A wide variety of approaches are presented from geological field studies and laboratory analyses of fault zone and fault rock properties to numerical fluid flow modelling and from seismological data analyses to coupled hydraulic and rheological modelling The publication aims to illustrate the importance of understanding fault zone complexity by integrating such diverse approaches and its impact on the rheological and fluid flow behaviour of fault zones in different contexts
