Machine Learning Ryszard S. Michalski, George Tecuci, 1994-02-09 Multistrategy learning is one of the newest and most promising research directions in the development of machine learning systems The objectives of research in this area are to study trade offs between different learning strategies and to develop learning systems that employ multiple types of inference or computational paradigms in a learning process Multistrategy systems offer significant advantages over monostrategy systems They are more flexible in the type of input they can learn from and the type of knowledge they can acquire As a consequence multistrategy systems have the potential to be applicable to a wide range of practical problems This volume is

the first book in this fast growing field It contains a selection of contributions by leading researchers specializing in this area See below for earlier volumes in the series

Goal-driven Learning Ashwin Ram, David B. Leake, 1995 Brings together a diversity of research on goal driven learning to establish a broad interdisciplinary framework that describes the goal driven learning process In cognitive science artificial intelligence psychology and education a growing body of research supports the view that the learning process is strongly influenced by the learner's goals The fundamental tenet of goal driven learning is that learning is largely an active and strategic process in which the learner human or machine attempts to identify and satisfy its information needs in the context of its tasks and goals its prior knowledge its capabilities and environmental opportunities for learning This book brings together a diversity of research on goal driven learning to establish a broad interdisciplinary framework that describes the goal driven learning process It collects and solidifies existing results on this important issue in machine and human learning and presents a theoretical framework for future investigations The book opens with an overview of goal driven learning research and computational and cognitive models of the goal driven learning process This introduction is followed by a collection of fourteen recent research articles addressing fundamental issues of the field including psychological and functional arguments for modeling learning as a deliberative planful process experimental evaluation of the benefits of utility based analysis to guide decisions about what to learn case studies of computational models in which learning is driven by reasoning about learning goals psychological evidence for human goal driven learning and the ramifications of goal driven learning in educational contexts The second part of the book presents six position papers reflecting ongoing research and current issues in goal driven learning Issues discussed include methods for pursuing psychological studies of goal driven learning frameworks for the design of active and multi-strategy learning systems and methods for selecting and balancing the goals that drive learning

Generating Abstraction Hierarchies Craig A. Knoblock, 2012-12-06 Generating Abstraction Hierarchies presents a completely automated approach to generating abstractions for problem solving The abstractions are generated using a tractable domain independent algorithm whose only inputs are the definition of a problem space and the problem to be solved and whose output is an abstraction hierarchy that is tailored to the particular problem The algorithm generates abstraction hierarchies that satisfy the ordered monotonicity property which guarantees that the structure of an abstract solution is not changed in the process of refining it An abstraction hierarchy with this property allows a problem to be decomposed such that the solution in an abstract space can be held invariant while the remaining parts of a problem are solved The algorithm for generating abstractions is implemented in a system called ALPINE which generates abstractions for a hierarchical version of the PRODIGY problem solver Generating Abstraction Hierarchies formally defines this hierarchical problem solving method shows that under certain assumptions this method can reduce the size of a search space from exponential to linear in the solution size and describes the implementation of this method in PRODIGY The abstractions generated by ALPINE are tested in multiple

domains on large problem sets and are shown to produce shorter solutions with significantly less search than problem solving without using abstraction. Generating Abstraction Hierarchies will be of interest to researchers in machine learning planning and problem reformation. **Change of Representation and Inductive Bias** D. Paul Benjamin, 2012-12-06

Change of Representation and Inductive Bias One of the most important emerging concerns of machine learning researchers is the dependence of their learning programs on the underlying representations especially on the languages used to describe hypotheses. The effectiveness of learning algorithms is very sensitive to this choice of language: choosing too large a language permits too many possible hypotheses for a program to consider, precluding effective learning; but choosing too small a language can prohibit a program from being able to find acceptable hypotheses. This dependence is not just a pitfall; however, it is also an opportunity. The work of Saul Amarel over the past two decades has demonstrated the effectiveness of representational shift as a problem solving technique. An increasing number of machine learning researchers are building programs that learn to alter their language to improve their effectiveness. At the Fourth Machine Learning Workshop held in June 1987 at the University of California at Irvine, it became clear that both the machine learning community and the number of topics it addresses had grown so large that the representation issue could not be discussed in sufficient depth. A number of attendees were particularly interested in the related topics of constructive induction, problem reformulation, representation selection, and multiple levels of abstraction. Rob Holte, Larry Rendell, and I decided to hold a workshop in 1988 to discuss these topics. To keep this workshop small, we decided that participation be by invitation only. **Evolutionary**

Computing David Corne, Jonathan L. Shapiro, 1997-10-15 This book constitutes the refereed post-workshop proceedings of the AISB International Workshop on Evolutionary Computing held in Manchester, UK, in April 1997. The 22 strictly reviewed and revised full papers presented were selected for inclusion in the book after two rounds of refereeing. The papers are organized in sections on evolutionary approaches to issues in biology and economics, problem structure and finite landscapes, evolutionary machine learning and classifier systems, evolutionary scheduling, and more techniques and applications of evolutionary algorithms. **Metareasoning** Michael T. Cox, Anita Raja, 2011 Experts report on the latest artificial intelligence research concerning reasoning about reasoning itself.

Metalearning Pavel Brazdil, Jan N. van Rijn, Carlos Soares, Joaquin Vanschoren, 2022-02-22 This open access book offers a comprehensive and thorough introduction to almost all aspects of metalearning and automated machine learning (AutoML), covering the basic concepts and architecture, evaluation, datasets, hyperparameter optimization, ensembles, and workflows, and also how this knowledge can be used to select, combine, compose, adapt, and configure both algorithms and models to yield faster and better solutions to data mining and data science problems. It can thus help developers to develop systems that can improve themselves through experience. As one of the fastest growing areas of research in machine learning, metalearning studies principled methods to obtain efficient models and solutions by adapting machine learning and data mining processes. This adaptation usually exploits information from past

experience on other tasks and the adaptive processes can involve machine learning approaches As a related area to metalearning and a hot topic currently AutoML is concerned with automating the machine learning processes Metalearning and AutoML can help AI learn to control the application of different learning methods and acquire new solutions faster without unnecessary interventions from the user This book is a substantial update of the first edition published in 2009 It includes 18 chapters more than twice as much as the previous version This enabled the authors to cover the most relevant topics in more depth and incorporate the overview of recent research in the respective area The book will be of interest to researchers and graduate students in the areas of machine learning data mining data science and artificial intelligence
