Multitrophic Interactions In Terrestrial Systems British Ecological Society Symposium Volume:

Multitrophic Interactions in Terrestrial Systems A. C. Gange, V. K. Brown, 2002-08 Multitrophic interactions are now recognised as being of the utmost importance in understanding the complexity of the natural world. However, their complex nature has often been a barrier to their study as they require research teams composed of workers often with very disparate interests. This book therefore takes a multidisciplinary approach to complex interactions across many trophic levels and includes authors from disciplines as diverse as mycology, entomology, nematology, population ecology and theoretical ecology. Throughout, the direct and indirect interactions between organisms from different trophic levels are emphasised in comprehensive reviews bringing a fresh collaborative approach to community ecology. The book is ideal for those seeking an overview of our understanding of multitrophic interactions as well as directions for future research. Multitrophic Level Interactions Teja Tscharntke, Bradford A. Hawkins, 2002-03-21 The multitrophic level approach to ecology addresses the complexity of food webs much more realistically than the traditional focus on simple systems and interactions. Only in the last few decades have ecologists become interested in the nature of more complex systems including tritrophic interactions between plants, herbivores and natural enemies. Plants may directly influence the behaviour of their herbivores, natural enemies, ecological interactions between two species are often indirectly mediated by a third species, landscape structure directly affects local tritrophic interactions and below ground food webs are vital to above ground organisms. The relative importance of top down effects (control by predators) and bottom up effects (control by resources) must also be determined. These interactions are explored in this exciting volume by expert researchers from a variety of ecological fields. This book provides a much needed synthesis of multitrophic level interactions and serves as a guide for future research for ecologists of all descriptions. **Bacilli and Agrobiotechnology: Phytostimulation and Biocontrol** Md Tofazzal Islam, M. Mahfuz Rahman, Piyush Pandey, Michael Henry Boehme, Geert Haesaert, 2020-01-01 The Gram positive and spore forming Bacilli are the most dominant group of bacteria that exist in various ecological niches on the earth. They represent one of the most important unmapped pools of biodiversity with immense potential of applications in agriculture, environment and industry. As these bacteria are highly tolerant to stressful environment and enhance plant tolerance to harsh environment such as salinity, drought and heavy metal toxicity, plant associated Bacilli have high potential for promoting sustainable crop production. Many species of Bacilli are being commercially used as phytostimulators and biofertilizers. Some of them are applied as biopesticides for protecting crop plants from phytopathogens and insect pests. The Bacillus based products are becoming popular in ecologically sound and climate resilient agricultural production systems. In fact, Bacillus and allied species based formulations are already dominating the biopesticides market although to compete with other formulations and chemical alternatives, the biology of Bacillus has to be understood from the perspective of such applications. Our understanding of the biology and molecular basis of the beneficial effects of plant associated Bacilli has greatly been progressed in recent years through

genomics metagenomics post genomics and metabolomics studies The volume two of the series Bacilli and Agrobiotechnology comprehensively reviews and updates current knowledge of Bacilli as phytostimulant and biological control of plant pests Better understanding the biology ecology and mechanism of action of the beneficial strains of Bacilli will play a role in the development of products to support green biotechnology in agriculture and industries Rules and Exceptions in Biology: from Fundamental Concepts to Applications Alfredo V. Peretti, Lucía S. Calbacho-Rosa, Paola A. Olivero, Mariela A. Oviedo-Diego, David E. Vrech, 2024-05-17 This is the first book to cover and explore the rules and exceptions in biology It presents past and current perspectives on the subject and discusses the various situations of transition from rule to exception and vice versa In doing so the book fills a gap in the scientific literature and stimulates useful and valuable discussions among researchers working in biology worldwide The chapters begin with a theoretical framework followed by the main topics or questions and a summary of previous work on the topic Examples are discussed with concluding remarks and suggestions for future research A section with key concepts is included at the end of each chapter allowing the reader to jump directly to the most important findings or observations Each chapter is written to be used as a reference by graduate students and professionals from a variety of scientific disciplines e g behavior ecology evolution and systematics
