Outer Solar System Linda T. Elkins-Tanton,2006 Explores the relationship between the Sun and the three outer planets of the solar system from the point of view of a planetary scientist examining the role of Uranus Neptune and Pluto as recorders of the formation of the solar system *The Moons of Neptune: Understanding Our Solar System for 5-12 year olds* James McAuror, In the cold silent and dark parts of our solar system far beyond where Saturn s rings shine the giant blue planet Neptune slowly orbits the Sun For thousands of years people looked at the night sky but no one ever knew Neptune was there It is so far away that it is completely invisible without a telescope Scientists actually found it using math before they ever saw it They noticed that the planet Uranus was being pulled by something they couldn t see and they figured out that another giant planet must be hiding in the darkness In the year 1846 astronomers in Germany pointed their telescope exactly where the mathematicians told them to look and there it was a faint blue disk They had discovered Neptune It was a huge moment for science Immediately astronomers all over the world wanted to learn everything they could about this new mysterious world One of these astronomers was an Englishman named William Lassell He wasn t just a scientist he was also a successful brewer who used his money to build one of the best telescopes in the world It had a giant metal mirror to collect light which allowed him to see things that were very faint and far away Just seventeen days after the world learned about Neptune Lassell aimed his powerful telescope at the new planet He was hoping to see its surface or maybe some clouds

Instead he saw something else a tiny steady pinprick of light moving right alongside the planet He watched it carefully over the next few nights and realized it was orbiting Neptune He had discovered Neptune s first moon Lassell named it Triton after the son of the Greek sea god It was an amazing discovery to make so quickly but Triton is so big that it was the easiest of Neptune s secrets to find After that incredible start the story of Neptune went quiet For years and years astronomers looked at the planet but all they ever saw was the big blue world and its one giant moon Triton A whole century passed That s one hundred years of looking and finding nothing new It seemed like Neptune was a lonely place While planets like Jupiter and Saturn had whole families of moons Neptune just had Triton Scientists began to wonder if there was anything else hiding in the darkness Neptune is so far from the Sun that it receives very little light Any other moons would likely be much smaller and darker than Triton making them almost impossible to see in the glare of the giant planet **Neptune** Susan Ring,2013
