Regions of Recent Star Formation Herzberg Institute of Astrophysics, 1982-02-28 Proceedings of the Symposium on Neutral Clouds Near HII Regions Dynamics and Photochemistry held in Penticton British Columbia 24-26 June 1981

**Regions of Recent Star Formation** R.S. Bohn, P.E. Dewdney, 2012-12-06 The symposium on Neutral Clouds near HII Regions was prompted by an obvious need to bring together workers specifically interested in the dynamical and photochemical effects in regions showing clear evidence of on going star formation This is currently an area of considerable research activity with much new observational material over the wavelength range from X ray to radio Furthermore the field is beginning to mature No longer is molecular spectroscopy concerned only with the search for new lines and with preliminary surveys No longer are evolving HII regions modelled with the naive assumption of constant density Similarly ideas of successive star formation champagne and blister models of HII regions and refinements to abundance calculations are examples which show that theoretical initiative is keeping pace We were both surprised and gratified by the number of contributed papers and the extent to which they addressed the subject matter In the proceedings we have grouped these papers near the most appropriate of the four invited review papers The subjects of these reviews are in the general areas of Evolution of HII Regions Dynamical Interactions Chemistry in Active Regions and Infrared and Maser Sources The symposium comprised 42 orally presented papers and 23 poster papers All but two are reproduced in this volume

TENORIO-TAGLE (Ed), 1993-06-10 The enormously powerful phenomena of starbursts are examined in this book These spectacular star forming events are seen on large scales in some galaxies often triggered by galactic interactions An intriguing implication of starburst research is that active galactic nuclei AGN may not be powered by accreting black holes Instead theories are presented where compact powerhouses of dust enshrouded star formation lie at the core of AGN with supernovae exploding roughly once per year within massive nuclear concentrations of gas This book collects articles from a timely international conference in Elba Italy in 1992 these comprise a thorough review of the most important developments in galactic scale star formation since the starburst revolution of the late 1980s This text will introduce graduate students to this exciting area and keep experts abreast with rapid developments in it

*Star Formation in Galaxies*, 1987      *Galactic and Extragalactic Radio Astronomy* E. Bouton, Gerrit L. Verschuur, Kenneth I. Kellermann, 2012-12-06 Galactic and Extragalactic Radio Astronomy is a fundamental text for graduate students and professional astronomers and covers all aspects of radio astronomy beyond the solar system Each chapter is written by a renowned expert in the field and contains a review of a particular area of radio astronomy and presents the latest

observations and interpretations as well as an extensive view of the literature as of 1988 Topics covered include galactic continuum emission HII regions the diffuse interstellar medium interstellar molecules astronomical masers neutral hydrogen the galactic center radio stars supernova remnants pulsars extragalactic hydrogen radio galaxies and quasars the microwave background and cosmological radio sources *Astronomy: A Physical Perspective* Marc L. Kutner, 2003-07-31 This fully revised and updated text is a comprehensive introduction to astronomical objects and phenomena By applying some basic physical principles to a variety of situations students will learn how to relate everyday physics to the astronomical world Starting with the simplest objects the text contains explanations of how and why astronomical phenomena occur and how astronomers collect and interpret information about stars galaxies and the solar system The text looks at the properties of stars star formation and evolution neutron stars and black holes the nature of galaxies and the structure of the universe It examines the past present and future states of the universe and final chapters use the concepts that have been developed to study the solar system its formation the possibility of finding other planetary systems and the search for extraterrestrial life This comprehensive text contains useful equations chapter summaries worked examples and end of chapter problem sets

Astrophysics Abstracts aims to present a comprehensive documentation of literature in all fields of astronomy and astrophysics. Every effort will be made to ensure that the average time interval between the date of receipt of the original literature and publication of the abstracts will not exceed eight months. This time interval is near to that achieved by monthly abstracting journals compared to which our system of accumulating abstracts for about six months offers the advantage of greater convenience for the user. Volume 31 contains literature published in 1982 and received before July 15 1982 some older literature which was received late and which is not recorded in earlier volumes is also included. We acknowledge with thanks contributions to this volume by Dr J Bouska Prague who surveyed journals and publications in Czech and supplied us with abstracts in English.

Kunth, 1996     **Galaxy Merger Identification Methods, and Investigations of the Role of Mergers in Galaxy Evolution** Kiyooki Christopher Omori, 2024-12-26

This book offers new findings on the impact of galaxy mergers on galaxy evolution and related processes. Galaxies are astronomical objects composed of stars, gas, and dark matter. The main pathway for galaxy evolution in the currently accepted model for structure growth is through interactions and mergers or the process in which multiple galaxies interact, collide, and end up as one larger galaxy. Galaxy interactions and mergers are also considered to drive various processes pertaining to galaxy evolution such as star formation, active galactic nuclei (AGN) activity, and chemical evolution. As such, not only are merging galaxy systems important to understand galaxy structure growth in a cosmological context, they are also unique laboratories to study evolutionary processes taking place in galaxies. However, despite their importance, the relative role of galaxy mergers on galaxy evolution is still heavily contested. One reason for this is difficulty in identifying merger galaxies in observational data. Many different methods have been adopted for merger galaxy identification, but none of them are perfect. Moreover, the use of differing selection methods can result in widely different samples which can alter statistical results. As such, a novel, robust method for merger identification is required to deepen our understanding of galaxy mergers. In this book, we introduce new methods to identify galaxy mergers from observational data. The first method combines the use of visual identification, both of optical and kinematic images, with spectroscopic pair identification. The second is machine learning based, using a training method called fine-tuning, an application of transfer learning. A pre-trained model on galaxy images is further fine-tuned using a sample of synthetic galaxy images to make a classifier for merger identification. Using samples identified by our methods, the author conducts three studies: the impact of mergers on galaxy chemical evolution, the effect of galaxy local environment

on merging activity and the connection between mergers and AGN activity This book is mainly intended for astrophysicists particularly those studying galaxies however is open for all to read
