**EU and the USA** Ann-Marie Jahn,2016-01-12 Bachelor Thesis from the year 2012 in the subject Economy Health Economics grade First Berlin School of Economics and Law language English abstract Innovations in the medical device industry have improved the health of the world population with the ability to better diagnose prevent predict and cure illnesses The number of medical devices on the market is increasing exponentially together with the complexity diversity and technical variation of such products In light of its impact on patient health regulation of medical devices is necessary to ensure that safe and

effective products enter the marketplace and that the product's benefit to the patient population outweighs its potential risks. Although there has been increasing public scrutiny of health care reform, medical devices and their global regulation have been a minor field of health economic studies. This study examines the medical device regulatory systems and its impact on health care economics exemplarily on the legislative programs of two major markets: the United States (U.S.) and European Union (EU). Modern medical device technology dates its origin to the early 19th century but has grown most significantly in the last 50 years. Banta p 15. Today 10 000 different families of medical device types exist with more than 400 000 different individual products on the market. Eucomed 2011. Outstanding developments have included heart lung machines, artificial joints as well as radiographic imaging and the means to perform advanced brain surgery. The medical device technology sector is extremely innovative with seven out of ten major medical innovations in the last 40 years coming from this field. Fuchs Sox JR 2001. Despite these technological advances, medical devices sometimes fail during use and can actually result in patient harm. The purpose of regulating medical equipment is to minimize the risk of harm to the end user and to prevent potentially unsafe products from entering the marketplace. The main obstacle in developing and implementing effective regulation is the term safety itself as it can hardly be measured and there is no formula that can be consistently applied. Guidelines have been established that measure product risk, mitigate risks where possible and then evaluate the residual risks to determine which are acceptable. This means by implication that acceptance of risk is part of the regulation process in order to bring life saving technologies with unknown long term effects to the market.

**Medical Regulatory Affairs** Jack Wong, Raymond Tong, 2025-04-16. This handbook covers medical device regulatory systems in different countries, ISO standards for medical devices, clinical trial and regulatory requirements and documentation for application. **Handbook of Polymer Applications in Medicine and Medical Devices** Vinny R. Sastri, 2013-12-05 Over the past 2000 years many devices have been developed and used in the mitigation and diagnosis of diseases The materials used in these devices have ranged from stone wood metal ceramics and most recently plastics Medical devices have also evolved in sophistication and complexity over time With the formalization of the scientific method in the seventeenth century such devices became more prevalent 1

Many medical devices were manufactured by doctors or small companies and sold directly to the public with no government standards or oversight. With the explosion of medical technology in the early twentieth century, several intermediaries had evolved between the medical device industry and the public. In 1879, Dr. E. R. Squibb, in an address to the Medical Society of the State of New York, proposed the enactment of a national statute to regulate food and drugs.<sup>2</sup> It was not until 27 years later that the Food and Drug Act of 1906 was introduced into the Congress and signed into law by President Theodore Roosevelt.<sup>3</sup> At that time, devices that were harmful to human safety and health proliferated the market, but regulation of medical devices by the Bureau of Chemistry, the precursor to the Food and Drug Administration (FDA), was limited to challenging commercial products only after they had been released into the market. Devices in the marketplace that were defective, adulterated, or misbranded were seized, and the device manufacturers were prosecuted in a court of law, but only after the products were sold in the market and caused harm to the end users. Thus, there was a strong need for regulating the devices before they entered the marketplace. An FDA report<sup>4</sup> issued in September 1970 detailed as many as 10,000 injuries and 731 deaths from ineffective medical devices. The report recommended the formation of a regulatory system and body that would enforce the production and sale of safe and effective devices to the public. All medical devices already on the market would be inventoried and classified into a three-tiered system based on their criticality of end use. It also detailed requirements for records and reports, registration and inspection of establishments, and uniform quality assurance programs called good manufacturing practices (GMP). After much lobbying by the FDA, Senate bill SR 510, The Medical Device Amendments of 1973, was introduced by Senator Edward M. Kennedy and was passed by the Senate in 1975. House bill HR 11124, introduced by Representative Paul Rogers, was passed by the House in 1976. These bills eventually became the Medical Device Amendments of 1976 and were signed into law by President Nixon. The Medical Device Amendments of 1976 became the basis for the medical device regulation in the United States to control and regulate the production of finished devices and thus the device manufacturers themselves.
