Lectures on Finite Precision Computations Francoise Chaitin-Chatelin, Valerie Fraysse, 1996-01-01 Mathematics of Computing Numerical Analysis

Theory of Heat Transfer with Forced Convection Film Flows De-Yi Shang, 2010-12-01

Developing a new treatment of Free Convection Film Flows and Heat Transfer began in Shang's first monograph and is continued in this monograph. The current book displays the recent developments of laminar forced convection and forced film condensation. It is aimed at revealing the true features of heat and mass transfer with forced convection film flows to model the deposition of thin layers. The novel mathematical similarity theory model is developed to simulate temperature and concentration dependent physical processes. The following topics are covered in this book:

1. Mathematical methods: advanced similarity analysis method to replace the traditional Falkner-Skan type transformation; a novel system of similarity analysis and transformation models to overcome the difficult issues of forced convection and forced film flows; heat and mass transfer equations based on the advanced similarity analysis models and equations formulated with rigorous key numerical solutions.
2. Modeling the influence of physical factors: effect of thermal dissipation on forced convection heat transfer; a system of models of temperature and concentration dependent variable physical properties based on the advanced temperature parameter model and rigorous analysis model on vapor-gas mixture physical properties for the rigorous and convenient description of the governing differential equations; an available approach to satisfy interfacial matching conditions for rigorous and reliable solutions; a system of numerical results on velocity, temperature, and concentration fields as well as key solutions on heat and mass transfer; the effect of non-condensable gas on heat and mass transfer for forced film condensation.

This way, it is realized to conveniently and reliably predict heat and mass transfer for convection and film flows and to resolve a series of current difficult issues of heat and mass transfer with forced convection film flows. Professionals in this field as well as graduate students will find this a valuable book for their work.
