### Infection Control Concepts – Lecture One/Class One

**Infection:** A disease state resulting from the entry and multiplication of a pathogen in the tissues of a host, causing the body to manifest clinical signs and symptoms. If the infection can be transmitted from one person to another, it is a communicable disease.

#### Cycle of infection

The development of an infection depends on the following:

- An infectious agent (pathogen)
- A reservoir (source for pathogen growth)
- A portal of exit from the reservoir
- A mode of transmission
- A portal of entry to host
- A susceptible host

An infection develops if this chain remains intact.

What makes a pathogen able to produce an infection?

- A sufficient number of organisms
- Virulence, or the ability to produce disease
- The ability to enter and survive in the host
- The susceptibility of the host

**Reservoir:** A place where a pathogen can survive but may or may not multiply. Ex: Hepatitis A virus survives in shellfish but does not survive. Our bodies are also an example of a reservoir.

When a pathogen is present on or in the body but does not cause harm, the pathogen is *colonizing*.

To thrive, pathogens require a reservoir that provides:

- Food
- Oxygen (or none)
- Water
- Appropriate temp
- Appropriate pH
- Minimal light
