Todinov, 2021-10-13 This book introduces a new method based on algebraic inequalities for optimising engineering systems and processes with applications in mechanical engineering materials science electrical engineering reliability engineering risk management and operational research This book shows that the application potential of algebraic inequalities in engineering and technology is far reaching and certainly not restricted to specifying design constraints Algebraic inequalities can handle deep uncertainty associated with design variables and control parameters With the method presented in this book powerful new knowledge about systems and processes can be generated through meaningful interpretation of algebraic inequalities. This book demonstrates how the generated knowledge can be put into practice through covering the algebraic inequalities suitable for interpretation in different contexts and describing how to apply this knowledge to enhance system and process performance Depending on the specific interpretation knowledge applicable to different systems from different application domains can be generated from the same algebraic inequality Furthermore an important class of algebraic inequalities has been introduced that can be used for optimising systems and processes in any area of science and technology provided that the variables and the separate terms of the inequalities are additive quantities With the presented various examples and solutions this book will be of interest to engineers students and researchers in the field of optimisation engineering design reliability engineering risk management and operational research Proceedings of the 10th International Conference on Rotor Dynamics -**IFToMM** Katia Lucchesi Cavalca, Hans Ingo Weber, 2018-08-20 IFToMM conferences have a history of success due to the

various advances achieved in the field of rotor dynamics over the past three decades These meetings have since become a leading global event bringing together specialists from industry and academia to promote the exchange of knowledge ideas and information on the latest developments in the dynamics of rotating machinery The scope of the conference is broad including e g active components and vibration control balancing bearings condition monitoring dynamic analysis and stability wind turbines and generators electromechanical interactions in rotor dynamics and turbochargers The proceedings are divided into four volumes This fourth volume covers the following main topics aero engines turbochargers eolian wind generators automotive rotating systems and hydro power plants
