Reinforced Composites From Polyester Resins:

Reinforced Composites from Polyester Resins Maurice William Ranney, 1972 *short fiber reinforced composite materials*, 1982 Advanced fibre-reinforced polymer (FRP) composites for structural applications N. Miskolczi, 2013-09-30

The chapter discusses the use of one type of thermoset polymer polyester and its use as a matrix material in fibre reinforced polymer FRP composites. It begins with an overview of FRP composites before explaining why polyester is a particularly suitable material for this application through discussion of its key properties and structures and the manufacturing processes involved. Composites can offer improved mechanical properties compared with pure polymers at no extra cost meaning that they are widely used in a variety of applications including in the transport industry manufacturing passenger cars and other vehicles marine and shipping uses and as structural materials. Some examples of these applications particularly in civil engineering are provided in this chapter along with discussion of potential future trends in the field.

Investigation of Styrene-Free Unsaturated Polyester Resins for Fiber-Reinforced Composites Yili Wu, 2016

Most of existing commercial unsaturated polyester UPE resins are typically composed of a UPE and a high amount of highly volatile flammable and toxic styrene. The emission of hazardous styrene in the handling of the UPE resins and the preparation and use of fiber reinforced UPE composites poses severe hazards to people's health and the working environment. In this study two non hazardous chemicals have been investigated for the replacement of styrene in the UPE resins. The first chemical is acrylated epoxidized soybean oil AESO that is derived from soybean oil and is not toxic and not volatile. The second chemical is methyl cinnamate that is extensively used as a food additive. Styrene free UPE resins were prepared through combinations of these styrene replacements and three different UPEs. The styrene free UPE resins were cured without the reinforcement of fibers and then

evaluated and characterized for their properties Kenaf fibers and glass fibers have been investigated as reinforcing fibers for the styrene free UPE resins An efficient process of making the fiber reinforced UPE composites was developed The viscosity and the pot life of the styrene free UPE resins under different temperature were studied The curing behavior of the resins under heat was investigated The viscoelastic properties of the cured UPE resins and the fiber reinforced UPE composites were characterized with dynamic mechanical analyses Mechanical properties such as flexural and tensile properties of the composites were measured It was found that these styrene replacements were comparable or even superior to styrene in terms of the mechanical properties of the composites The weight ratio between a styrene replacement and a UPE was studied in detail for maximizing mechanical properties The curing mechanisms of these styrene free UPE resins are discussed in detail

Holm Altenbach,Johannes W. Altenbach,Wolfgang Kissing,2013-11-11 Laminate and sandwich structures are typical lightweight elements with rapidly expanding application in various industrial fields In the past these structures were used primarily in aircraft and aerospace industries Now they have also found application in civil and mechanical engineering in the automotive industry in ship building the sport goods industries etc The advantages that these materials have over traditional materials like metals and their alloys are the relatively high specific strength properties the ratio strength to density etc In addition the laminate and sandwich structures provide good vibration and noise protection thermal insulation etc There are also disadvantages for example composite laminates are brittle and the joining of such elements is not as easy as with classical materials The recycling of these materials is also problematic and a viable solution is yet to be developed

Since the application of laminates and sandwiches has been used mostly in new technologies governmental and independent research organizations as well as big companies have spent a lot of money for research This includes the development of new materials by material scientists new design concepts by mechanical and civil engineers as well as new testing procedures and standards The growing demands of the industry for specially educated research and practicing engineers and material scientists have resulted in changes in curricula of the diploma and master courses More and more universities have included special courses on laminates and sandwiches and training programs have been arranged for postgraduate studies
