The Handbook of Shock Waves contains a comprehensive structured coverage of research topics related to shock wave phenomena including shock waves in gases liquids solids and space Shock waves represent an extremely important physical phenomena which appears to be of special practical importance in three major fields compressible flow aerodynamics materials science and astrophysics Shock waves comprise a phenomenon that occurs when pressure builds to force a reaction i e sonic boom that occurs when a jet breaks the speed of sound This Handbook contains experimental theoretical and numerical results which never before appeared under one cover the first handbook of its kind The Handbook of Shock Waves is intended for researchers and engineers active in shock wave related fields Additionally R D establishments applied science research laboratories and scientific and engineering libraries both in universities and government institutions As well as undergraduate and graduate students in fluid mechanics gas dynamics and physics

**Key Features** Ben Dor is known as one of the founders of the field of shock waves Covers a broad spectrum of shock wave research topics Provides a comprehensive description of various shock wave related subjects First handbook ever to include under one separate cover experimental theoretical and numerical results      *Shock Wave Reflection Phenomena* Gabi Ben-Dor, 2007-08-28 This book is a comprehensive state of the knowledge summation of shock wave reflection phenomena from a phenomenological point of view It includes a thorough introduction to oblique shock wave reflections dealing with both regular and Mach types It also covers in detail the corresponding two and three shock theories The book moves on to describe reflection phenomena in a variety of flow types as well as providing the resolution of the Neumann paradox      **Sir James Lighthill And Modern Fluid Mechanics** Lokenath Debnath, 2008-07-16 This is perhaps the first book containing biographical information of Sir James Lighthill and his major scientific contributions to the different areas of fluid mechanics applied mathematics aerodynamics linear and nonlinear waves in fluids geophysical fluid dynamics biofluid dynamics aeroelasticity boundary layer theory generalized functions and Fourier series and integrals Special efforts is made to present Lighthill s scientific work in a simple and concise manner and generally intelligible to readers who have some introduction to fluid mechanics The book also includes a list of Lighthill s significant papers Written for the mathematically literate reader this book also provides a glimpse of Sir James serious attempt to stimulate interest in mathematics and its diverse

applications among the general public of the world his profound influence on teaching of mathematics and science with newer applications and his deep and enduring concern on enormous loss of human lives economic and marine resources by natural hazards By providing detailed background information and knowledge sufficient to start interdisciplinary research it is intended to serve as a ready reference guide for readers interested in advanced study and research in modern fluid mechanics a     Theoretical Fluid Dynamics Bhimsen K. Losev, Aleksei Iosifovich Osipov, 1967     A Technique for Determining Relaxation Times by Free-flight Tests of Low-fineness-ratio Cones; with Experimental Results for Air at Equilibrium Temperatures Up to 3440 K* Jack D. Stephenson, 1960 This report describes a technique which combines theory and experiments for determining relaxation times in gases The technique is based on the measurement of shapes of the bow shock waves of low fineness ratio cones fired from high velocity guns The theory presented in the report provides a means by which shadowgraph data showing the bow waves can be analyzed so as to furnish effective relaxation times Relaxation times in air were obtained by this technique and the results have been compared with values estimated from shock tube measurements in pure oxygen and nitrogen The tests were made at velocities ranging from 4600 to 12 000 feet per second corresponding to equilibrium temperatures from 35900 R 19900 K to 6200 R 34400 K under which conditions at all but the highest temperatures the effective relaxation times were determined primarily by the relaxation time for oxygen and nitrogen vibrations
