Making the Modern World Vaclav

Smil, 2013-10-02 How much further should the affluent world push its material consumption Does relative dematerialization lead to absolute decline in demand for materials These and many other questions are discussed and answered in Making the

Modern World Materials and Dematerialization Over the course of time the modern world has become dependent on unprecedented flows of materials Now even the most efficient production processes and the highest practical rates of recycling may not be enough to result in dematerialization rates that would be high enough to negate the rising demand for materials generated by continuing population growth and rising standards of living This book explores the costs of this dependence and the potential for substantial dematerialization of modern economies Making the Modern World Materials and Dematerialization considers the principal materials used throughout history from wood and stone through to metals alloys plastics and silicon describing their extraction and production as well as their dominant applications The evolving productivities of material extraction processing synthesis finishing and distribution and the energy costs and environmental impact of rising material consumption are examined in detail The book concludes with an outlook for the future discussing the prospects for dematerialization and potential constraints on materials This interdisciplinary text provides useful perspectives for readers with backgrounds including resource economics environmental studies energy analysis mineral geology industrial organization manufacturing and material science

Used Battery Collection and Recycling G. Pistoia, J.-P. Wiaux, S.P.

Wolsky, 2001-11-08 *Used Battery Collection and Recycling* covers all aspects of spent battery collection and recycling. First of all, the legislative and regulatory updates are addressed, and the main institutions and programs worldwide are mentioned. An overview of the existing battery systems, the chemicals used in them, and their hazardous properties is made, followed by a survey of the major industrial recycling processes. The safety and efficiency of such processes are stressed. Particular consideration is given to the released emissions, i.e., to the impact on human health and the environment. Methods for the evaluation of this impact are described. Several chapters deal with specific battery chemistries: lead acid, nickel cadmium, and nickel metal hydride, zinc carbon, and alkaline lithium and lithium ion. For each type of battery, details are provided on the collection, recycling process from the technical, economic, and environmental viewpoint. The chemicals recoverable from each process and remarketable are mentioned. A chapter deals with recovering of the large batteries powering electric vehicles, e.g., lead acid, nickel metal hydride, and lithium ion. The final chapter is devoted to the important topic of collecting batteries from used electrical and electronic equipment. The uncontrolled disposal of these devices still containing their batteries contributes to environmental pollution.

Part One of the book describes general concepts of crystal structure, microstructure, and related factors on the mechanical, thermal, magnetic, and electronic properties of nonferrous metals, intermetallic compounds, and metal matrix composites. Part Two discusses all the nonferrous metallic elements from two perspectives. First, it explains how the concepts presented in Part One define the properties of a particular metallic element and its alloys. Second, it is a description of the major engineering uses of each metal. This section features sidebar pieces describing particular physical property oddities, engineering applications, and case studies. An Instructor's Manual presenting detailed solutions to all the problems in the book is available from the Wiley editorial department.
