## **Mathematical Models For Speech Technology:**

*Mathematical Models for Speech Technology* Stephen Levinson, 2005-05-13 Mathematical Models of Spoken Language presents the motivations for intuitions behind and basic mathematical models of natural spoken language communication A comprehensive overview is given of all aspects of the problem from the physics of speech production through the hierarchy of linguistic structure and ending with some observations on language and mind The author comprehensively explores the argument that these modern technologies are actually the most extensive compilations of linguistic knowledge available Throughout the book the emphasis is on placing all the material in a mathematically coherent and computationally tractable framework that captures linguistic structure It presents material that appears nowhere else and gives a unification of formalisms and perspectives used by linguists and engineers Its unique features include a coherent nomenclature that emphasizes the deep connections amongst the diverse mathematical models and explores the methods by means of which they capture linguistic structure This contrasts with some of the superficial similarities described in the existing literature the historical background and origins of the theories and models the connections to related disciplines e g artificial intelligence automata theory and information theory an elucidation of the current debates and their intellectual origins many important little known results and some original proofs of fundamental results e g a geometric interpretation of parameter estimation techniques for stochastic models and finally the author's own unique perspectives on the future of this discipline There is a vast literature on Speech Recognition and Synthesis however this book is unlike any other in the field Although it appears to be a rapidly advancing field the fundamentals have not changed in decades Most of the results are presented in journals from which it is difficult to integrate and evaluate all of these recent ideas Some of the fundamentals have been collected into textbooks which give detailed descriptions of the techniques but no motivation or perspective The linguistic texts are mostly descriptive and pictorial lacking the mathematical and computational aspects This book strikes a useful balance by covering a wide range of ideas in a common framework It provides all the basic algorithms and computational techniques and an analysis and perspective which allows one to intelligently read the latest literature and understand state of the art techniques as they evolve

*Mathematical Modeling and Signal Processing in Speech and Hearing Sciences* Jack Xin, Yingyong Qi, 2014-04-14 The aim of the book is to give an accessible introduction of mathematical models and signal processing methods in speech and hearing sciences for senior undergraduate and beginning graduate students with basic knowledge of linear algebra differential equations numerical analysis and probability Speech and hearing sciences are fundamental to numerous technological advances of the digital world in the past decade from music compression in MP3 to digital hearing aids from network based voice enabled services to speech interaction with mobile phones Mathematics and computation are intimately related to these leaps and bounds On the other hand speech and hearing are strongly interdisciplinary areas where dissimilar scientific and engineering publications and approaches often coexist and make it

difficult for newcomers to enter      Mathematical Foundations of Speech and Language Processing Mark Johnson, Sanjeev P. Khudanpur, Mari Ostendorf, Roni Rosenfeld, 2012-12-06 Speech and language technologies continue to grow in importance as they are used to create natural and efficient interfaces between people and machines and to automatically transcribe, extract, analyze and route information from high volume streams of spoken and written information. The workshops on Mathematical Foundations of Speech Processing and Natural Language Modeling were held in the Fall of 2000 at the University of Minnesota's NSF sponsored Institute for Mathematics and Its Applications as part of a Mathematics in Multimedia year long program. Each workshop brought together researchers in the respective technologies on the one hand and mathematicians and statisticians on the other hand for an intensive week of cross fertilization. There is a long history of benefit from introducing mathematical techniques and ideas to speech and language technologies. Examples include the source channel paradigm, hidden Markov models, decision trees, exponential models and formal languages theory. It is likely that new mathematical techniques or novel applications of existing techniques will once again prove pivotal for moving the field forward. This volume consists of original contributions presented by participants during the two workshops. Topics include language modeling, prosody, acoustic phonetic modeling and statistical methodology      **Springer Handbook of Speech Processing** Jacob Benesty, M. M. Supervised Sequence Labelling with Recurrent Neural Networks Alex Graves, 2012-02-09. Supervised sequence labelling is a vital area of machine learning encompassing tasks such as speech, handwriting and gesture recognition, protein secondary structure prediction and part of speech tagging. Recurrent neural networks are powerful sequence learning tools, robust to input noise and distortion, able to exploit long range contextual information that would seem ideally suited to such problems. However their role in large scale sequence labelling systems has so far been auxiliary. The goal of this book is a complete framework for classifying and transcribing sequential data with recurrent neural networks only. Three main innovations are introduced in order to realise this goal. Firstly the connectionist temporal classification output layer allows the framework to be trained with unsegmented target sequences such as phoneme level speech transcriptions; this is in contrast to previous connectionist approaches which were dependent on error prone prior segmentation. Secondly multidimensional recurrent neural networks extend the framework in a natural way to data with more than one spatio-temporal dimension such as images and videos. Thirdly the use of hierarchical subsampling makes it feasible to apply the framework to very large or high resolution sequences such as raw audio or video. Experimental validation is provided by state of the art results in speech and handwriting recognition.
