applications In part I Background it provides a general introduction which succinctly summarizes the linguistic cognitive and computational foundations of anaphora processing and the key classical rule and machine learning based anaphora resolution algorithms Acknowledging the central importance of shared resources part II Resources covers annotated corpora formal evaluation preprocessing technology and off the shelf anaphora resolution systems Part III Algorithms provides a thorough description of state of the art anaphora resolution algorithms covering enhanced machine learning methods as well as techniques for accomplishing important subtasks such as mention detection and acquisition of relevant knowledge Part IV Applications deals with a selection of important anaphora and coreference resolution applications discussing particular scenarios in diverse domains and distilling a best practice model for systematically approaching new application cases In the concluding part V Outlook based on a survey conducted among the contributing authors the prospects of the research field of anaphora processing are discussed and promising new areas of interdisciplinary cooperation and emerging application scenarios are identified Given the book s design it can be used both as an accompanying text for advanced lectures in computational linguistics natural language engineering and computer science and as a reference work for research and independent study It addresses an audience that includes academic researchers university lecturers postgraduate students advanced undergraduate students industrial researchers and software engineers **An Introduction to Functional Analysis** Charles Swartz,1992-01-28 Based on an introductory graduate level course given by Swartz at New Mexico State U this textbook written for students with a moderate knowledge of point set topology and integration theory explains the principles and theories of functional analysis and their applications showing the interpla Modern Optimisation Techniques in Power Systems Yong-Hua Song,1999-05-31 Under an ever increasingly competitive deregulated environment power utilities need efficient and effective tools to ensure that electrical energy of the desired quality can be provided at the lowest cost These usually form highly constrained optimisation problems Modern Optimisation Techniques in Power Systems is the first book to offer a comprehensive cover of major modern optimisation methods applied to power systems including simulated annealing tabu search genetic algorithms neural networks fuzzy programming Lagrangian relaxation interior point methods ant colony search and hybrid techniques Various applications and case studies are presented to demonstrate the potential and procedures of applying such techniques in solving complex power system optimisation problems Written by top international experts in this field this book will be a useful reference for professional engineers and managers involved in the optimisation of power system operation It will also be of interest to postgraduates and researchers **Subject Guide to Books in Print** ,1997 *An Introduction to Game-Theoretic Modelling: Third Edition* Mike Mesterton-Gibbons,2019-07-05 This book introduces game theory and its applications from an applied mathematician s perspective systematically developing tools and concepts for game theoretic modelling in the life and social sciences Filled with down to earth examples of strategic behavior in humans and other animals the book presents a unified account of the central ideas of both classical

and evolutionary game theory Unlike many books on game theory which focus on mathematical and recreational aspects of the subject this book emphasizes using games to answer questions of current scientific interest In the present third edition the author has added substantial new material on evolutionarily stable strategies and their use in behavioral ecology The only prerequisites are calculus and some exposure to matrix algebra probability and differential equations *Introduction to Shape Optimization* Jan Sokolowski,Jean-Paul Zolesio,2012-12-06 This book is motivated largely by a desire to solve shape optimization prob lems that arise in applications particularly in structural mechanics and in the optimal control of distributed parameter systems Many such problems can be formulated as the minimization of functionals defined over a class of admissible domains Shape optimization is quite indispensable in the design and construction of industrial structures For example aircraft and spacecraft have to satisfy at the same time very strict criteria on mechanical performance while weighing as little as possible The shape optimization problem for such a structure consists in finding a geometry of the structure which minimizes a given functional e g such as the weight of the structure and yet simultaneously satisfies specific constraints like thickness strain energy or displacement bounds The geometry of the structure can be considered as a given domain in the three dimensional Euclidean space The domain is an open bounded set whose topology is given e g it may be simply or doubly connected The boundary is smooth or piecewise smooth so boundary value problems that are defined in the domain and associated with the classical partial differential equations of mathematical physics are well posed In general the cost functional takes the form of an integral over the domain or its boundary where the integrand depends smoothly on the solution of a boundary value problem **Optimization Methods and Applications** Xiao-qi Yang,Kok Lay Teo,Lou Caccetta,2013-03-14 This edited book is dedicated to Professor N U Ahmed a leading scholar and a renowned researcher in optimal control and optimization on the occasion of his retirement from the Department of Electrical Engineering at University of Ottawa in 1999 The contributions of this volume are in the areas of optimal control non linear optimization and optimization applications They are mainly the im proved and expanded versions of the papers selected from those presented in two special sessions of two international conferences The first special session is Optimization Methods which was organized by K L Teo and X Q Yang for the International Conference on Optimization and Variational Inequality the City University of Hong Kong Hong Kong 1998 The other one is Optimal Control which was organized byK Teo and L Caccetta for the Dynamic Control Congress Ottawa 1999 This volume is divided into three parts Optimal Control Optimization Methods and Applications The Optimal Control part is concerned with com putational methods modeling and nonlinear systems Three computational methods for solving optimal control problems are presented i a regularization method for computing ill conditioned optimal control problems ii penalty function methods that appropriately handle final state equality constraints and iii a multilevel optimization approach for the numerical solution of opti mal control problems In the fourth paper the worst case optimal regulation involving linear time varying systems is formulated as a minimax optimal con trol problem

Books in Print ,1991 **Linear Matrix Inequalities for Robust Control** Richard Charles Lind,1995 **Topics in Applied Analysis and Optimisation** Michael Hintermüller,José Francisco Rodrigues,2019-11-27 This volume comprises selected revised papers from the Joint CIM WIAS Workshop TAAO 2017 held in Lisbon Portugal in December 2017 The workshop brought together experts from research groups at the Weierstrass Institute in Berlin and mathematics centres in Portugal to present and discuss current scientific topics and to promote existing and future collaborations The papers include the following topics PDEs with applications to material sciences thermodynamics and laser dynamics scientific computing nonlinear optimization and stochastic analysis **Optimal Control of Discrete Time Stochastic Systems** C. Striebel,2013-12-21 **Cluster Analysis** B. S. Duran,P. L. Odell,2013-03-08 A tremendous amount of work has been done over the last thirty years in cluster analysis with a significant amount occurring since 1960 A substantial portion of this work has appeared in many journals including numerous applied journals and a unified ex position is lacking The purpose of this monograph is to supply such an exposition by presenting a brief survey on cluster analysis The main intent of the monograph is to give the reader a quick account of the prob lem of cluster analysis and to expose to him the various aspects thereof With this intent in mind much detail has been omitted particularly in so far as detailed examples are considered Most of the references stated within the text contain examples and the reader can consult them for additional information on specific topics Efforts were made to include in the reference section all papers that played a role in developing the theory of cluster analysis Any omission of such references was not intentional and we would appreciate knowing about them Many references to papers in applied journals are also contained however the list is far from being complete This monograph has been greatly influenced by the work of many people most notably J A Hartigan D Wishart J K Bryan R E Jensen H D Vinod and M R Rao Several portions of the monograph were motivated by research performed under the support of NASA Manned Spacecraft Center Earth Observations Division under Contract NAS 9 12775 Optimal Subset Selection David Boyce,A. Farhi,R. Weischedel,2013-03-08 In the course of one s research the expediency of meeting contractual and other externally imposed deadlines too often seems to take priority over what may be more significant research findings in the longer run Such is the case with this volume which despite our best intentions has been put aside time and again since 1971 in favor of what seemed to be more urgent matters Despite this delay to our knowledge the principal research results and documentation presented here have not been superseded by other publications The background of this endeavor may be of some historical interest especially to those who agree that research is not a straightforward mechanistic process whose outcome or even direction is known in ad vance In the process of this brief recounting we would like to express our gratitude to those individuals and organizations who facilitated and supported our efforts We were introduced to the Beale Kendall and Mann algorithm the source of all our efforts quite by chance Professor Britton Harris suggested to me in April 1967 that I might like to attend a CEIR half day seminar on optimal regression being given by Professor M G Kendall in Washington D C I

agreed that the topic seemed interesting and went along Had it not been for Harris suggestion and financial support this work almost certainly would have never begun   Variable Structure Systems with Application to Economics and Biology R. R. Mohler,A. Ruberti,2012-12-06 The proceedings of the Second US Italy Seminar on Variable Structure Systems is published in this volume Like the first seminar its conception evolved from common research interests on bilinear systems at the Istituto di Automatica of Rome University and at the Electrical and Computer Engineering Department of Oregon State University Again the seminar was focused on variable structure systems in general In this case however emphasis is given to applications in biology and economics along with theoretical investi gations which are so necessary to establish a unified theory and to motivate further developments in these applications of social significance By bringing together the talents of social and biological scientists with those of engineers and mathematicians from throughout Italy and the United States the seminar was intended to yield a cross pollination of significant results and a base for more meaningful future research The editors are encouraged by the progress with which they hope the reader will agree is made in this direction No pretense is made however that completely satisfactory integration of theore tical results and applications has been accomplished at this time Among the more important conclusions which have resulted from this seminar are that bilinear and more general variable structure models arise in a natural manner from basic principles for certain biological and economic processes

Linear Multivariable Control W. M. Wonham,2013-11-21 In writing this monograph my objective is to present arecent geometrie approach to the structural synthesis of multivariable control systems that are linear time invariant and of finite dynamic order The book is addressed to graduate students specializing in control to engineering scientists engaged in control systems research and development and to mathematicians with some previous acquaintance with control problems The label geometrie is applied for several reasons First and obviously the setting is linear state space and the mathematics chiefly linear algebra in abstract geometrie style The basic ideas are the familiar system concepts of controllability and observability thought of as geometrie properties of distinguished state subspaces Indeed the geometry was first brought in out of revulsion against the orgy of matrix manipulation which linear control theory mainly consisted of not so long ago But secondlyand of greater interest the geometrie setting rather quickly suggested new methods of attacking synthesis which have proved to be intuitive and economical they are also easily reduced to matrix arith metic as soonas you want to compute The essence of the geometrie approach is just this instead of looking directly for a feedback laW say u Fx which would solve your synthesis problem if a solution exists first characterize solvability as a verifiable property of some constructible state subspace say J Then if all is weIl you may calculate F from J quite easily   Supercritical Wing Sections II F. Bauer,P. Garabedian,D. Korn,A. Jameson,2012-12-06 This handbook is a sequel to an earlier volume entitled A Theory of Supercritical Wing Sections with Computer Programs and Examples Since the completion of the first volume which we shall refer to as Volume I cf ll some effort has been made to improve our airfoil design program A number of more desirable air foils have

been designed In addition several of our wing sections have been tested in wind tunnels We should like to make this material available here since it is more convenient to use the design program in conjunction with data for a fairly broad range of examples Moreover we have developed new analysis programs that supersede our previous work Chapter I is devoted to a brief discussion of the mathematics involved in our additions and modifications There is only a mini mum emphasis on theory since the representation of important physical phenomena such as boundary layer shock wave interaction and separation is partly empirical It is our contention however that the computer programs provide a better simulation than might have been expected Chapter II presents numerical results found by our new methods as well as comparisons with experimental data Chapter III contains a discussion of the use of the program together with Fortran listings **An Introduction to Fuzzy Linear Programming Problems** Jagdeep Kaur,Amit Kumar,2016-04-02 The book presents a snapshot of the state of the art in the field of fully fuzzy linear programming The main focus is on showing current methods for finding the fuzzy optimal solution of fully fuzzy linear programming problems in which all the parameters and decision variables are represented by non negative fuzzy numbers It presents new methods developed by the authors as well as existing methods developed by others and their application to real world problems including fuzzy transportation problems Moreover it compares the outcomes of the different methods and discusses their advantages disadvantages As the first work to collect at one place the most important methods for solving fuzzy linear programming problems the book represents a useful reference guide for students and researchers providing them with the necessary theoretical and practical knowledge to deal with linear programming problems under uncertainty **Mathematical Principles of the Internet, Volume 2** Nirdosh Bhatnagar,2018-11-21 This two volume set on Mathematical Principles of the Internet provides a comprehensive overview of the mathematical principles of Internet engineering The books do not aim to provide all of the mathematical foundations upon which the Internet is based Instead they cover a partial panorama and the key principles Volume 1 explores Internet engineering while the supporting mathematics is covered in Volume 2 The chapters on mathematics complement those on the engineering episodes and an effort has been made to make this work succinct yet self contained Elements of information theory algebraic coding theory cryptography Internet traffic dynamics and control of Internet congestion and queueing theory are discussed In addition stochastic networks graph theoretic algorithms application of game theory to the Internet Internet economics data mining and knowledge discovery and quantum computation communication and cryptography are also discussed In order to study the structure and function of the Internet only a basic knowledge of number theory abstract algebra matrices and determinants graph theory geometry analysis optimization theory probability theory and stochastic processes is required These mathematical disciplines are defined and developed in the books to the extent that is needed to develop and justify their application to Internet engineering **Topological Methods in Walrasian Economics** E. Dierker,2012-12-06 In winter 71 72 I held a seminar on general equilibrium theory for a jOint group of students in

mathematics and in econo mics at the university of Bonn w Germany1 The economists how ever had a mathematical background well above the average Most of the material treated in that seminar is described in these notes The connection between smooth preferences and smooth demand func tions see Debreu 1972 and regular economies based on agents with smooth preferences are not presented here Some pedagogical difficulties arose from the fact that elementary knowledge of algebraic topology is not assumed although it is helpful and indeed necessary to make some arguments precise It is only a minor restriction at present that functional ana lysis is not used But with the development of the theory more economic questions will be considered in their natural infinite dimensional setting Economic knowledge is not required but especially a reader without economic background will gain much by reading Debreu s classic Theory of Value 1959 Although the formulation of our economic problem uses a map between Euclidean spaces only we shall also consider ma folds Manifolds appear in our situation because inverse images under differentiable mappings between Euclidean spaces are very often differentiable manifolds Under differentiability assump tions for instance the graph of the equilibrium set correspon
