*Infectious Disease Modeling* Xinzhi Liu, Peter Stechlinski, 2017-02-25 This volume presents infectious diseases modeled mathematically taking seasonality and changes in population behavior into account using a switched and hybrid systems framework The scope of coverage includes background on mathematical epidemiology including classical formulations and results a motivation for seasonal effects and changes in population behavior an investigation into term time forced epidemic models with switching parameters and a detailed account of several different control strategies The main goal is to study these models theoretically and to establish conditions under which

eradication or persistence of the disease is guaranteed In doing so the long term behavior of the models is determined through mathematical techniques from switched systems theory Numerical simulations are also given to augment and illustrate the theoretical results and to help study the efficacy of the control schemes
