Mathematics of Financial Markets Robert J Elliott, P. Ekkehard Kopp, 2013-11-11 This work is aimed at an audience with a sound mathematical background wishing to learn about the rapidly expanding field of mathematical finance Its content is suitable particularly for graduate students in mathematics who have a background in measure theory and probability The emphasis throughout is on developing the mathematical concepts required for the theory within the context of their application No attempt is made to cover the bewildering variety of novel or exotic financial instruments that now appear on the derivatives markets the focus throughout remains on a rigorous development of the more basic options that lie at the heart of the remarkable range of

current applications of martingale theory to financial markets The first five chapters present the theory in a discrete time framework Stochastic calculus is not required and this material should be accessible to anyone familiar with elementary probability theory and linear algebra The basic idea of pricing by arbitrage or rather by nonarbitrage is presented in Chapter 1 The unique price for a European option in a single period binomial model is given and then extended to multi period binomial models Chapter 2 introduces the idea of a martingale measure for price processes Following a discussion of the use of self financing trading strategies to hedge against trading risk it is shown how options can be priced using an equivalent measure for which the discounted price process is a martingale
