Krieger, 2012-11-19 *Doing Physics* makes concepts of physics easier to grasp by relating them to everyday knowledge Addressing some of the models and metaphors that physicists use to explain the physical world Martin H Krieger describes the conceptual world of physics by means of analogies to economics anthropology theater carpentry mechanisms such as clockworks and machine tool design The interaction of elementary particles or chemical species for example can be related to the theory of kinship who can marry whom is like what can interact with what Likewise the description of physical situations in terms of interdependent particles and fields is analogous to the design of a factory with its division of labor among specialists For the new edition Krieger has revised the text and added a chapter on the role of mathematics and formal models in physics *Doing Physics* will be of special interest to economists political theorists anthropologists and sociologists as well as philosophers of science **Bulletin of Additions to the Libraries, Classified, Annotated and Indexed** Glasgow (Scotland). Public Libraries, 1919 **The School World**, 1916 **Math for Machinists** Mark W. Huth, John Templeton, 2022-09-29 *Math for Machinists* provides students with a review of basic math operations whole numbers fractions decimals percentages and measurements and additional math topics directly applicable to machining and manufacturing such as precision measurements angles area volume gear calculations trigonometry and working with coordinate systems Creative machine shop related problems and pertinent exercises help students develop their math skills troubleshooting skills and their knowledge of the trade Updated by new author John Templeton this edition includes eight new units hundreds of additional applied practice problems plus many new end of unit review questions throughout the text

Convention, Subject, Calculation, Analogy (2nd Edition) Martin H Krieger, 2015-01-15 *Doing Mathematics* discusses some
ways mathematicians and mathematical physicists do their work and the subject matters they uncover and fashion The
conventions they adopt the subject areas they delimit what they can prove and calculate about the physical world and the
analogies they discover and employ all depend on the mathematics what will work out and what won't The cases studied
include the central limit theorem of statistics the sound of the shape of a drum the connections between algebra and topology
and the series of rigorous proofs of the stability of matter The many and varied solutions to the two dimensional Ising model
of ferromagnetism make sense as a whole when they are seen in an analogy developed by Richard Dedekind in the 1880s to
algebraicize Riemann's function theory by Robert Langlands program in number theory and representation theory and by the
analogy between one dimensional quantum mechanics and two dimensional classical statistical mechanics In effect we begin
to see an identity in a manifold presentation of profiles as the phenomenologists would say This second edition deepens the
particular examples it describe the practical role of mathematical rigor it suggests what might be a mathematician's
philosophy of mathematics and it shows how an ugly first proof or derivation embodies essential features only to be
appreciated after many subsequent proofs Natural scientists and mathematicians trade physical models and abstract objects
remaking them to suit their needs discovering new roles for them as in the recent case of the Painlevé transcendents the
Tracy Widom distribution and Toeplitz determinants And mathematics has provided the models and analogies the ordinary
language for describing the everyday world the structure of cities or God's infinitude
